Table of Tables

1. Introduction

This document is the 2016 Congestion Management Process (CMP) Update Report for the Killeen Temple Metropolitan Planning Organization (KTMPO) planning area (see Figure 1-2). The report describes the assumptions, methodology, performance measures, and potential congestion mitigation strategies included in the updated CMP.

Congestion Management Process (CMP)

Congestion management is the application of strategies to improve transportation system performance and reliability by reducing the adverse impacts of congestion on the movement of people and goods. A congestion management process (CMP) is a systematic approach for managing congestion that provides accurate, up-to-date information on transportation system performance and assesses alternative strategies for congestion management that meet state and local needs. The CMP is intended to produce transportation system performance measures and congestion management strategies that can be reflected in the regional metropolitan transportation plan (MTP) and transportation improvement program (TIP).

The CMP, as defined in federal regulation, is intended to serve as a systematic process that provides for safe and effective integrated management and operation of the multimodal transportation system. The process includes:

- Development of congestion management objectives;
- Establishment of measures of multimodal transportation system performance;
- Collection of data and system performance monitoring to define the extent and duration of congestion and determine the causes of congestion;
- Identification of congestion management strategies;
- Implementation activities, including identification of an implementation schedule and possible funding sources for each strategy; and
- Evaluation of the effectiveness of implemented strategies.

A CMP is required in metropolitan areas with population exceeding 200,000, these areas are known as Transportation Management Areas (TMAs). Federal requirements also state that all CMPs shall be developed and implemented as an integrated part of the metropolitan transportation planning process. The Congestion Management System (CMS) was first introduced by the Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 and was continued under successive transportation authorization laws, including the current law, Fixing America's Surface Transportation (FAST) Act. The CMP is intended to be an ongoing process, fully integrated into the metropolitan transportation planning process. The CMP is a "living" document, continually evolving to address the performance measure results, concerns of the community, new objectives and goals of the MPO, and up-to-date information on congestion issues.

KTMPO Congestion Management Process

The Killeen Temple Metropolitan Planning Organization (KTMPO) is the metropolitan planning organization (MPO) for the urbanized region surrounding the two cities. The general population of the KTMPO planning area, according to the 2014 US Census American Community Survey estimates, is 355,747. Figure 1-2 shows the KTMPO planning area, which was designated as a TMA in 2012. Within this area, KTMPO has the responsibility of coordinating safe and efficient movement of people and goods on the multi-modal public transportation system. The KTMPO multi-modal transportation system includes faciliites for pedestrians, bicylists, transit users, air transport users, and automobile/truck users.

This KTMPO CMP is modeled after the process suggested in the Federal Highway Administration's *Congestion Management Process: A Guidebook*. Figure 1-1 visualizes the step-by-step process, emphasizing the ongoing nature of the CMP. The eight step process includes the following actions:

Develop Regional Objectives – This step in the process answers the questions: "What is the desired outcome?" and "What do we want to achieve?" It may not be feasible or desirable to try to eliminate all congestion, and so in this step it is important to define the regional objectives for congestion management that are designed to achieve the desired outcome. Some MPOs also define congestion management principles, which shape how congestion is addressed from a policy perspective.

Define Network - This step in the process involves answering the question, "What components of the transportation system are the focus?" and involves defining both the geographic scope and system elements (e.g., freeways, major arterials, transit routes) that will be analyzed in the CMP.

Develop Performance Measures – In this step in the process, the CMP addresses the question, "How do we define and measure congestion?" This step involves developing performance measures to be used to measure congestion on both a regional and local scale. These performance measures should support the regional objectives.

Collect Data/Monitor System Performance - After performance measures are defined, the next step in the process is to collect and analyze data to determine, "How does the transportation system perform?" Data collection may be on-going, and involve a wide range of data sources from various planning partners.

Analyze Congestion Problems and Needs - Using available data and analysis techniques, in the next step in the process the CMP should address the questions, "What congestion problems are present in the region, or are anticipated?" and "What are the sources of unacceptable congestion?"

Identify and Assess Strategies - Working together with the MPO's planning partners, in the next step in the process the CMP should address the question, "What strategies are appropriate to mitigate congestion?" This step involves both identifying and assessing potential strategies, and may include efforts conducted as part of the development of the Metropolitan Transportation Plan (MTP), corridor studies, or project studies.

Figure 1-1: KTMPO CMP Model Process

Figure 1-1: KTMPO CMP Model Process
Figure 1-2: KTMPO Planning Area
Program and Implement Strategies – This step involves answering the question, "How and when will solutions be implemented?" The step typically involves: including strategies in the MTP; determining funding sources; prioritizing strategies; allocating funding in the TIP; and, ultimately, implementing the strategies.

Monitor Strategy Effectiveness – This step should assess, "What have we learned about implemented strategies?" This step will be tied closely to monitoring system performance and is designed to inform future decision making about the effectiveness of transportation strategies. From the lessons learned in this step, the process begins again in a continuous process of monitoring and improving congestion management processes within the region.

Goals and Objectives

As with any process, it is important to establish the process objectives from the outset. The objectives define what the MPO wants to achieve regarding the congestion management process, and are an essential part of an objectives-driven, performance-based approach to planning for congestion management. These objectives will also serve as one of the primary points of connection and coordination between the CMP and the MTP. The MPO developed goals and objectives for the 2013 CMP based on existing KTMPO planning documents and national best practices. The 2016 CMP Update maintains the same goals and objectives, which guide the actions necessary to maintain a safe efficient and convenient transportation system throughout the KTMPO region. The MPO will continue working to promote projects and policies that support the stated vision, goals, and objectives of this 2016 CMP Update.

KTMPO CMP Vision: "Maintain a safe efficient and convenient transportation system throughout the KTMPO region."

Goals and Objectives

Goal: Provide an efficient transportation system

- Promote policies and projects to reduce travel delay
- Promote awareness of alternative transportation modes

Goal: Provide a safe transportation system

- Promote policies and projects to reduce number of crashes and crash severity

Goal: Promote a variety of transportation alternatives

- Promote policies and programs to increase transit ridership on existing services
- Promote awareness of multi-modal facilities
- Promote carpool/shared-ride opportunities

Goal: Encourage programs and developments that promote a healthy environment

- Consider participation in air quality improvement programs
- Encourage community land development plans that balance access to all modes of transportation.

2. Congestion Management Data

- Recurring Congestion
  - Peak period
  - Freight
  - Intersection
  - Freeway corridor
  - Non freeway corridor
  - School related
  - Central Business District
  - Bottleneck or hot spot
  - Railroad crossing
  - Parking related
- Non-Recurring Congestion
  - Incident related
  - Special event traffic

Federal regulation 23 CFR 500.109 defines congestion as "the level at which transportation system performance is unacceptable due to excessive travel times and delays." According to the Federal Highway Administration (FHWA), roadway congestion is comprised of three key elements: severity, extent, and duration. However, congestion can have a different meaning depending on the context in which the congestion is experienced. Defining a CMP Network and developing performance measures to analyze congestion along the network are key steps in the CMP. These steps establish the foundation for the process, and are meant to define how congestion is perceived locally.

Congestion Data Sources

Before a CMP Network can be defined or performance measures can be determined, it is important to determine what data is available. The KTMPO CMP employs three main quantitative data sets, whose data coverage is shown in Figure 2-1, and one qualitative data set for analyzing congestion. The CMP also uses additional supplementary data from other sources that helps further the identification and analysis of congestion throughout the region.

National Performance Management Research Data Set (NPMRDS)

The NPMRDS is a vehicle probe-based data set developed by HERE and acquired by the FHWA to support the agency's Freight Performance Measures (FPM) and Urban Congestion Report (UCR) programs. The data set uses crowd-sourced GPS information, typically obtained from mobile phones, vehicles, and portable navigation devices, to provide monthly average travel times (in 5 minute intervals) along the National Highway System (NHS), Strategic Defense Network (STRAHNET), and principal arterials within five miles of a border crossing. The data is also packaged with a location referencing system, which is a network of segments called Traffic Message Channels (TMCs), which can be used in a geographic information system (GIS) to link travel time data to road segments. The data used in this CMP includes monthly data from 2014 for Bell, Coryell, and Lampasas Counties, and was obtained from TxDOT.

Although the NPMRDS separates probe data into passenger vehicle and freight vehicle data, this CMP Update uses the combined data to account for the effects of congestion on the movement of both people and goods throughout the region.

INRIX

The INRIX data set is similar to the NPMRDS in that it is a probe-based data set produced from GPS information taken from personal navigation devices. However, INRIX traffic data is presented in units of speed, instead of average travel time, averaged over 15 minute intervals. The INRIX speed data set used in this CMP is the 2013 version and was obtained from TxDOT, which packages the data with its Road-Highway Inventory Network (RHiNo) for location referencing and travel time calculation.

Regional Travel Demand Model (TDM)

A TDM is a representation of travel behavior throughout a transportation system network. The model uses roadway attributes and socioeconomic data such as population and employment to predict travel behavior. The latest KTMPO TDM uses 2010 and

forecasted 2040 demographic inputs to forecast travel demand along the TDM roadway network for different time periods. The TDM does not model travel behavior of modes of travel other than the roadway system. The TDM results provide estimates of vehicle travel times, speed, and traffic volumes along the roadway system of the region.

Google Traffic

Google Traffic is a feature in Google Maps that displays typical traffic conditions along roadways based on travel speed. Google Traffic aggregates crowd-sourced GPS information from smartphones to calculate speeds along roadway segments, which is then used to create an overlay in Google Maps which show traffic conditions on a scale from "fast" to "slow"—with "fast" meaning there is little congestion and "slow" meaning there is heavy congestion for a specific time period. Because the raw data is not publicly available, the CMP utilizes this data source qualitatively. Congestion data from Google

Traffic is collected by reviewing the typical traffic conditions overlay in Google Maps for specific time periods and indicating the severity of congestion for segments consistently displaying congestion. The process involves skimming through several time periods to identify segments with reoccurring congestion, noting the extent and travel direction of the congested roadway segment, and recording the magnitude of congestion.

Supplementary Data Sources

Outside of the four main congestion data sources, KTMPO also designed a survey to gather feedback from the public to determine the location and other characteristics of regional congestion. The survey was hosted online and received 222 unique responses over the one-month period that the survey was open. The survey revealed that many of the respondents perceived daily congestion to be a significant problem in the region, and mostly caused by roadway construction, inadequate road capacity, or ineffective traffic signals. Respondents also identified locations where congestion was the worst (Table 2-1) and provided information about each respondent's commuting patterns and strategies to avoid congestion. A complete summary of the survey results is available in Appendix B.

Crash data was also incorporated in the CMP as a way to account for non-recurring congestion, since incidents along a network may result in delays and unreliable travel times. Crash data for the region was obtained from TxDOT's Crash Records Information System (CRIS) from 2011 to 2015. The CRIS data provides information about the location of reported crashes (Figure 2-2), as well as different attributes that provide more detail about who was involved and the outcome of each crash (e.g. injury or fatality).

CMP Network

Defining a CMP Network involves specifying the geographic boundaries and transportation system components that are the basis of analysis and foundation of the congestion management process. Efforts to improve traffic conditions in the region begin on the CMP Network, and the level of congestion on this network serves as a gauge for overall congestion in the region.

Defining the CMP Network

In May 2013, KTMPO held a series of public workshops to collect input from the community on various transportation topics, including congestion. The public provided feedback about proposed CMP goals and identified congestion locations throughout the area (Figure 2-3). KTMPO staff combined the results from the workshops with congested corridor information provided by the regional public transit provider Hill Country Transit District (HCTD) and Texas Department of Transportation (TxDOT), creating a consolidated list of congested roadways. KTMPO Staff presented this list of roadways to the KTMPO Technical Advisory Committee and Transportation Planning Policy Board where it was approved as the official CMP Network for the region.

The 2013 CMP Network did not take into account quantitative data coverage. However, the 2016 CMP does use quantitative data. As a result of the analysis of this quantitative data, an expanded CMP Network was proposed for the 2016 CMP Update. The updated CMP Network (Figure 2-4) reflects the overlapping data coverage from the four congestion datasets mentioned previously, as well as information gathered from the congestion survey. The network is broken up into segments for analysis purposes, which are detailed in Table 2-2.

Performance Measures

Developing performance measures to identify, assess, and communicate to others about congestion is a critical element of the CMP. A performance measure is a quantifiable measure to assess how well the KTMPO region is meeting the established congestion management goals and objectives. Performance measures serve as indicators to better understand the usage of a transportation facility or the characteristics of travelers using the transportation system. Performance measures can also be assessed over time to indicate whether congestion management strategies are successful in meeting the establish goals and objectives of the CMP.

By monitoring performance and the outcomes from implemented improvement strategies, the quality of decision-making in the planning process can be improved and limited financial resources can be expended more wisely and effectively. The requirement for on-going assessment of the performance measures leads to the need to identify measures that are quantifiable, without placing a heavy burden on time, cost or training on KTMPO staff. This CMP establishes a set of performance measures that can be calculated from real world data on an annual basis and that provide KTMPO with useful information and trends to inform transportation investment decisions.

---

[1] Performance measures for this segment were not computed because the segment was not complete at the time data was collected for this CMP Update; future performance reports will likely include this segments as data becomes available.
[2] This segment will likely be referred to as Business 190 in future updates.

Identifying Performance Measures

The Federal CMP requirements do not mandate specific performance measures that must be used during the process. Identifying appropriate congestion performance measures is up to each MPO. Although there are a wide range of performance measures available, it was determined by KTMPO that those selected for this 2016 CMP Update must be understandable, outcome-oriented, and supported by readily available data sources.

The 2013 CMP recommended several performance measures. The 2016 CMP Update evaluated the 213 performance measures to determine whether the old performance measures meet current standards and need for quantifiable measurement. The following questions were considered to assist in identifying appropriate congestion management performance measures:

- Is the measure easily understandable to both the general public and elected officials?
- Does the MPO have the ability and adequate funding to collect the data to track the measure on an on-going basis?
- Does the measure provide the ability to track roadway congestion for the region overall, as well as for individual transportation facilities?
- Do the measures reflect the local definition of congestion?

Table 2-3 highlights the different performance measures previously considered for inclusion in the CMP, and the following sections below explain the measures in more detail.

Table 2-3: Performance Measures

Measure Category	(Sub-measures)	Recommended in:		Data Source
		2013 CMP	2016 CMP	
Corridor Level-of-Service		Yes	No	TDM
Volume-to-Capacity Ratios		Yes	**Yes**	TDM
Travel Time	Travel Time	Yes	No	INRIX, NPMRDS, Bluetooth, TDM
	Travel Speed	Yes	No	INRIX, NPMRDS, Bluetooth, TDM
	Average Delay	No	**Yes**	INRIX, NPMRDS, TDM
	Travel Time Index	No	**Yes**	INRIX
Intersection LOS		No	No	TDM
Safety	Number of crashes along a specified corridor	Yes	No	TxDOT CRIS
	Number of crashes at a particular intersection	Yes	No	TxDOT CRIS
	Type of crashes along a specified corridor	No	Yes	TxDOT CRIS
	Type of crashes at a particular intersection	No	No	TxDOT CRIS
	Number of crashes per million vehicle-miles over a section of roadway	No	**Yes**	CRIS/TDM
Transit	Transit ridership	Yes	No	HCTD, NTD
	Transit capacity along congested corridors	No	No	HCTD
	Transit availability	Yes	**Yes**	HCTD
Transportation Options/Availability of Alternative Modes		*Yes*	*No[3]*	*?*

---

[3] Availability of Alternative Modes was not recommended as a measure in the 2016 CMP Update. As KTMPO continues updating its multi-modal plans and inventory of bicycle and pedestrian facilities, future CMP updates could consider incorporating a measure for transportation options.

Volume-to-Capacity Ratios

In addition to being part of the LOS determination for a roadway, volume-to-capacity (V/C) ratios can be used separately as measure of congestion. V/C ratio is defined as the ratio of demand flow rate to capacity for a traffic facility. Using V/C ratios is popular because data on existing traffic volumes is relatively easy to obtain and the measures (traffic volumes and roadway capacities) can be forecasted by employing the area's TDM.

Travel Time Measures

Travel time measures focus on the time it takes to travel along a selected portion of a highway corridor. Common variations of travel time measures include the following:

○ Travel time – the amount of time needed to traverse a corridor segment
○ Travel speed – the length of a segment divided by the travel time
○ Travel time index – ratio of observed travel speed to free-flow travel speed

These travel time measures can be used for specific roadway segments, intersections, or corridors. The 2016 CMP Update uses the Travel Time Index (TTI) because it allows for direct comparison between different types of roadways in the region.

Delay Measures

Delay measures calculate the additional travel time experienced by drivers due to varying traffic conditions. In other words, delay is the difference between observed travel time and free flow travel time. Delay measures are dependent on how free flow travel time is defined. Free flow travel time could be derived from the posted speed limit or could be defined as the maximum observed travel time. Depending on how free flow travel time is defined, measures of delay can vary.

The 2016 CMP Update proposes using average delay per vehicle as the primary delay measure, supplemented by aggregated delay information where available.

Crash Measures

Crash measures identify high concentrations of crashes at particular locations along a corridor or at a particular turning movement at an intersection or cross street. Crashes certainly impact travel conditions, and can be the cause of nonrecurring congestion along corridors and intersections. Identifying "hot spot" crash locations, and examining the location in the field can assist in identifying potential projects to improve the safety and function of the roadway corridor or intersection. Common improvements could include improving sight distance, adding turn lanes, adding traffic signals, implementing street calming devices, etc. Crash data measures in the KTMPO area could include the following:

○ Number of crashes along a specified corridor
○ Number of crashes at a particular intersection
○ Type of crashes along a specified corridor
○ Type of crashes at a particular intersection
○ Number of crashes per million vehicle-miles over a section of roadway

There are some constraints to using crash measures to alleviate congestion. For instance, the type of crashes and how they are recorded can make it difficult to measure congestion from reviewing crash data. There may be reporting inconsistencies in the crash data that is documented by local enforcement agencies. Crashes may not be

reported or documented, and the exact crash location is not always recorded or accurate. While examining crash data is important in the overall planning process, the inconsistencies within crash data may detract from the suitability of crash measures to identify congested corridors. In the 2016 CMP Update, crash measures are used to supplement the primary congestion hotspot identification measures and prioritize the segments.

Transit Travel Condition Measures

Transit travel condition measures provide information on the conditions experienced by public transit users. Aspects of transit travel conditions include vehicle ridership vs. load capacity and on-time performance reliability. Thus, transit travel condition measures in the KTMPO area could include the following:

- Transit ridership
- Transit capacity along congested corridors
- Transit availability

Transit measures in the 2016 CMP Update are not used to identify congested locations, but are used during the congestion hotspot prioritization process.

Recommended Performance Measures

After considering the ease of access to and characteristics of the available quantitative data, the performance measures recommended for use in the 2016 CMP Update include:

Congestion Measures

- Travel Time Index
  - Average Daily
  - Maximum
- Delay
  - Average Daily
  - Peak Period
  - Annual Hours of Delay
- V/C Ratio (Current and Future)
  - Average Daily
  - Peak Period

Supplemental Measures

- Transit Availability
- Crash Rate
- Rear-end Crash Rate

3. Identification of Congestion Hotspots

Identifying congestion hotspots is part of determining specific congestion problems in the region. Part of the identification process also includes defining what levels of congestion are acceptable or unacceptable in the region. The process of congestion hotspot identification involves using the multiple available data sets to calculate performance measures along the CMP Network, and then aggregating those measures in a way that allows for easy comparison between segments. Finally, segments along the CMP Network are prioritized based on the results of the congestion data analysis, as well as other evaluation criteria, that support the goals and objectives of the CMP and ensure compatibility with other regional planning processes.

Data Analysis

There are many ways to analyze congestion, as reflected in the use of multiple performance measures and data sets throughout this CMP. By using these different measures in conjunction with one another, congestion hotspots can be identified with a relative degree of confidence. Using multiple performance measures and data sets also allows for flexibility in defining and identifying congestion, as certain measures from different sources can be weighted and presented differently to reflect congestion in a way that is specific to the region.

Before calculating congestion performance measures for the 2016 CMP Update, the data sets were first processed so that similar attributes or measures could be easily compared from one data set to the next. Using the three major quantitative congestion data sets (NPMRDS, INRIX, and the KTMPO TDM), performance measures were calculated depending on the data available within each data set. Table 3-1 shows how the quantitative congestion performance measures were calculated. Figures 3-1 through 3-4 show congestion in the region as measured through the Travel Time Index across the three quantitative datasets.

Table 3-1: Quantitative Congestion Performance Measure Descriptions

			NPMRDS	INRIX	TDM	Units of Measure
Travel Time Index (TTI)		Average	Average speed along segment/ average freeflow speed			Ratio
		Max	Minimum speed of any TMC along segment/ average freeflow speed	Minimum speed of any link along segment/ average freeflow speed		Ratio
Delay	Current	Average Daily	Average seconds of delay (per vehicle)[1] along segment / segment length	Average seconds of delay per vehicle along segment / segment length	Total seconds of delay for all links / Volume of all links averaged across segment/ segment length	Seconds per vehicle per mile
		Peak[2]	Maximum seconds of delay (per vehicle) along segment/ segment length	Maximum seconds of delay along segment / segment length		
		Annual		Sum of all observations of delay for all vehicles for entire year		Hours
	2040	Average				Ratio
		Increase				Percentage
VC Ratio	Current	Average			Volume/capacity (24-hr)	Ratio
		Peak[2]			Volume/capacity during peaks	
	2040	Average			Volume/capacity (24-hr) – 2040 forecast	
		Increase			% change VC ratio (current to 2040)	Percentage

---

[2] The peak period for KTMPO was defined as: 6AM-9AM for the AM Peak Period, and 4PM-7PM for the PM Peak Period. Peak period figures reflect observations from both the AM and PM peak period.

Figure 3-1: NPMRDS Travel Time Index
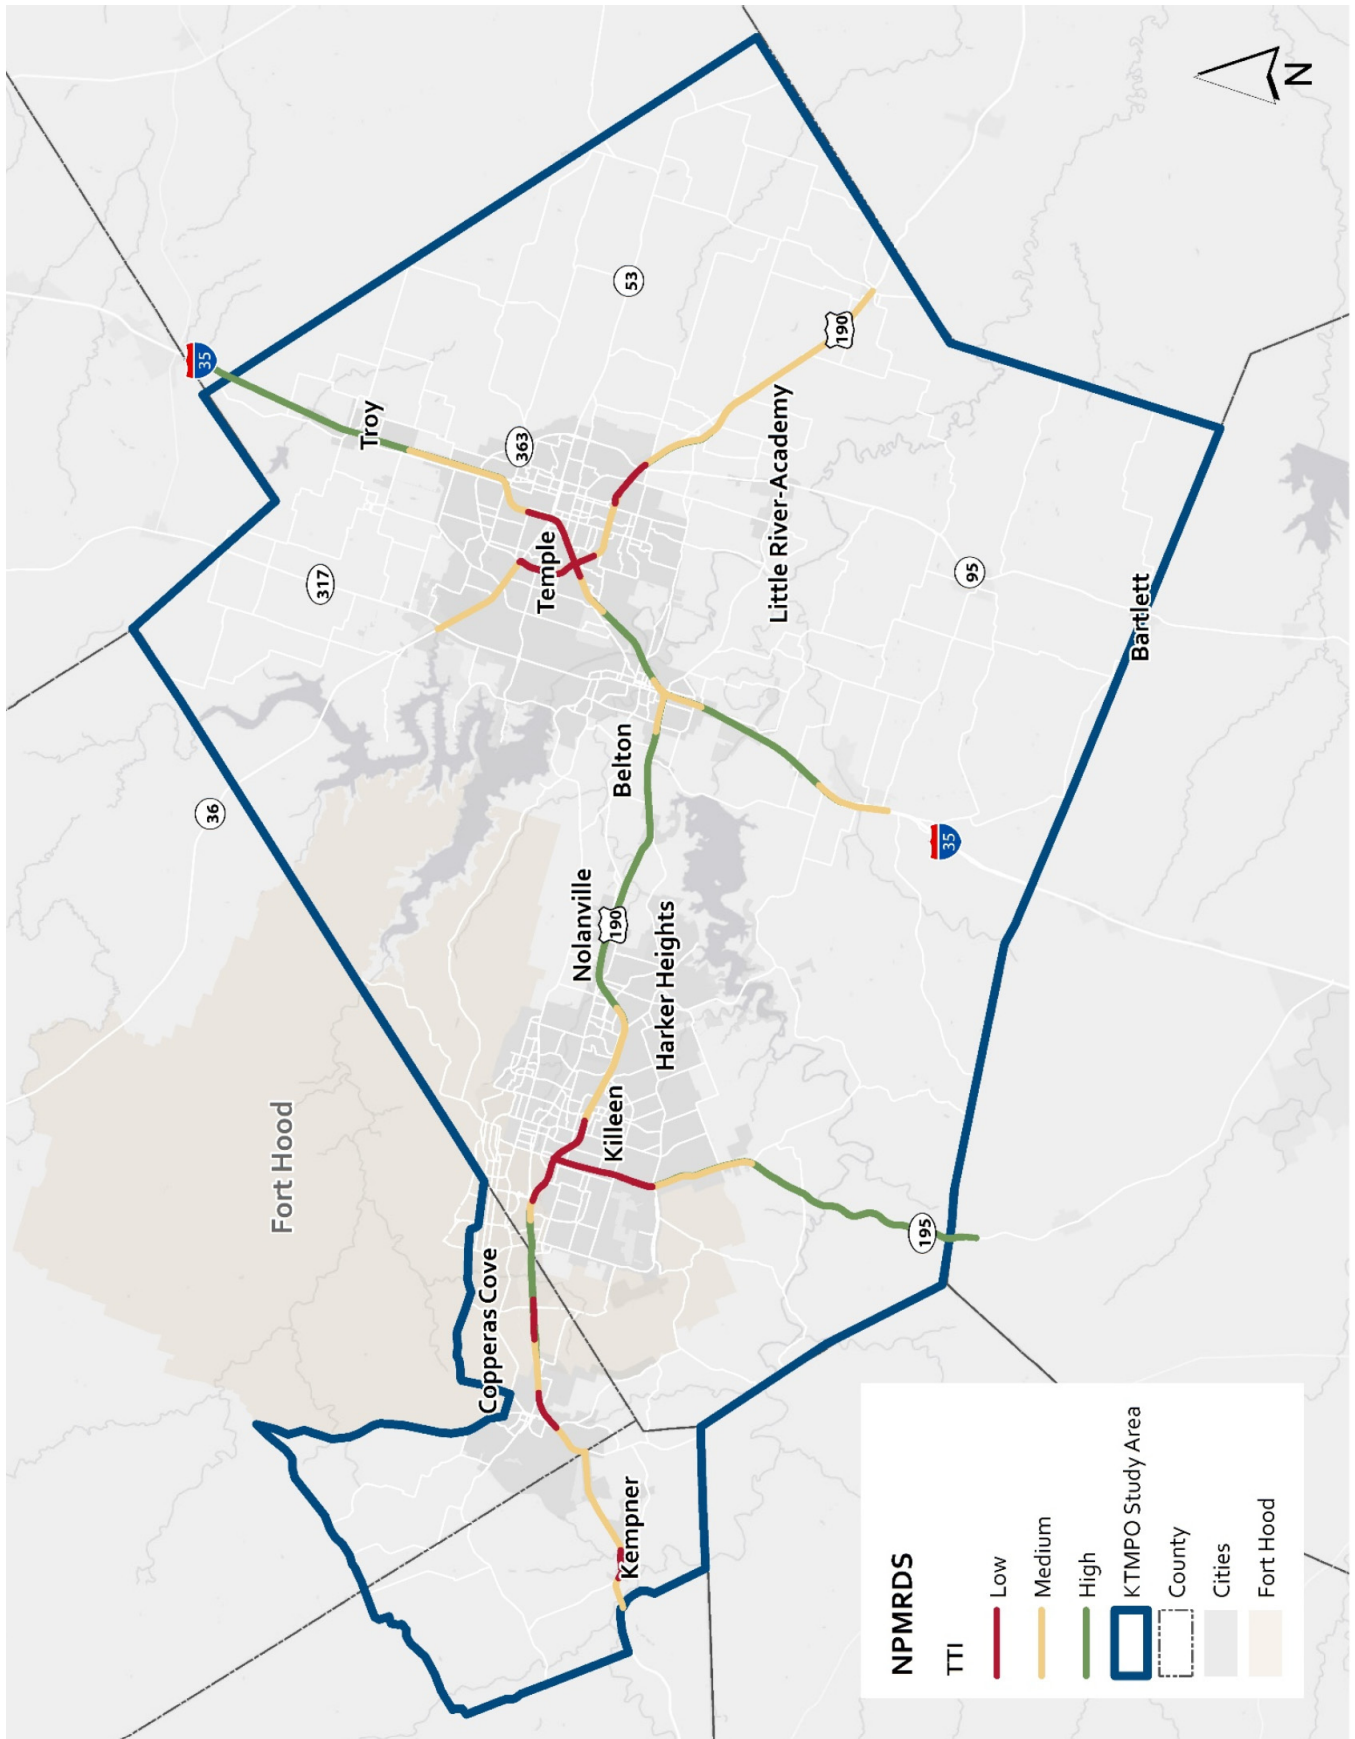

Figure 3-2: INRIX Travel Time Index
Figure 3-3: 2010 TDM Travel Time Index
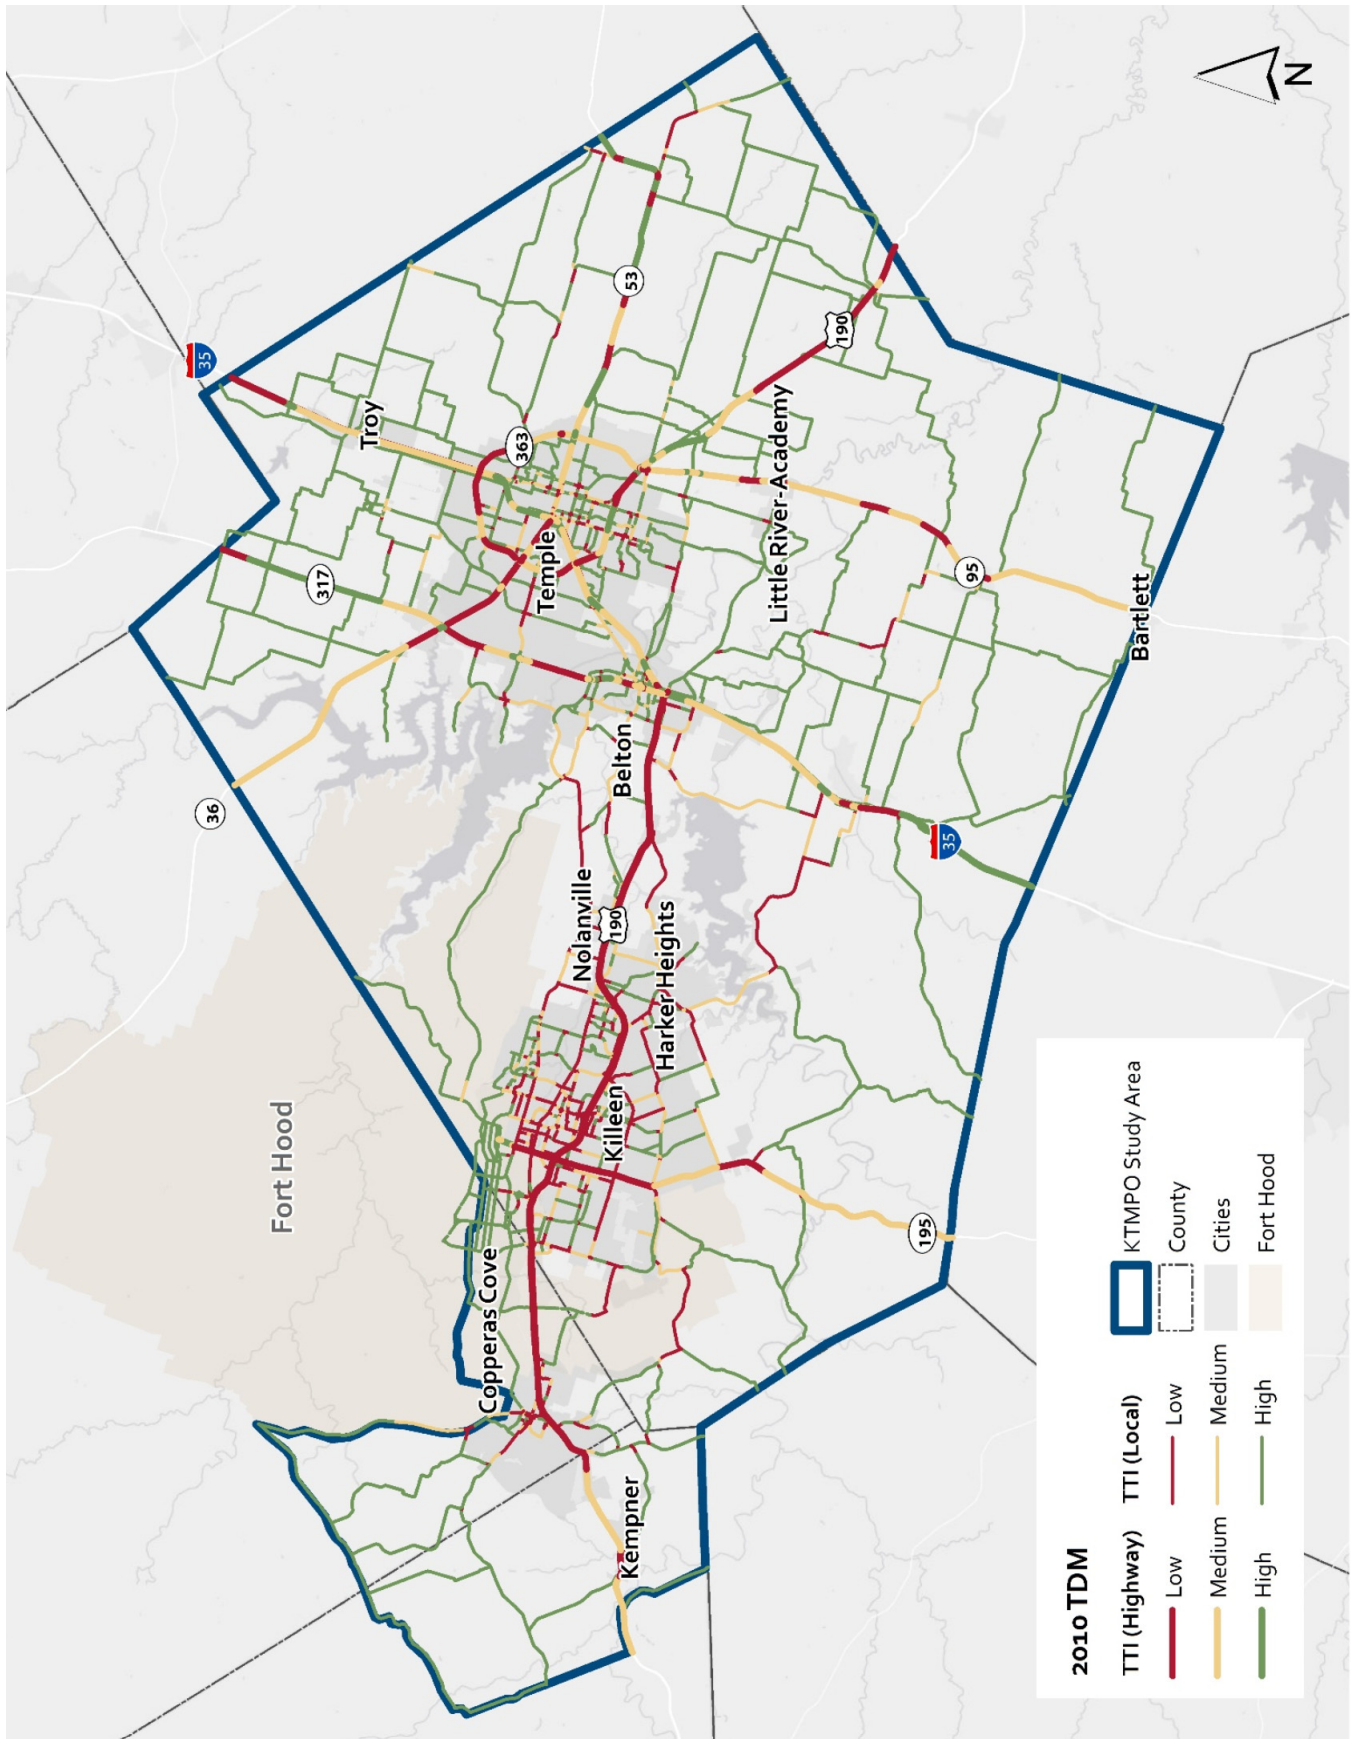

Figure 3-4: 2040 TDM Travel Time Index
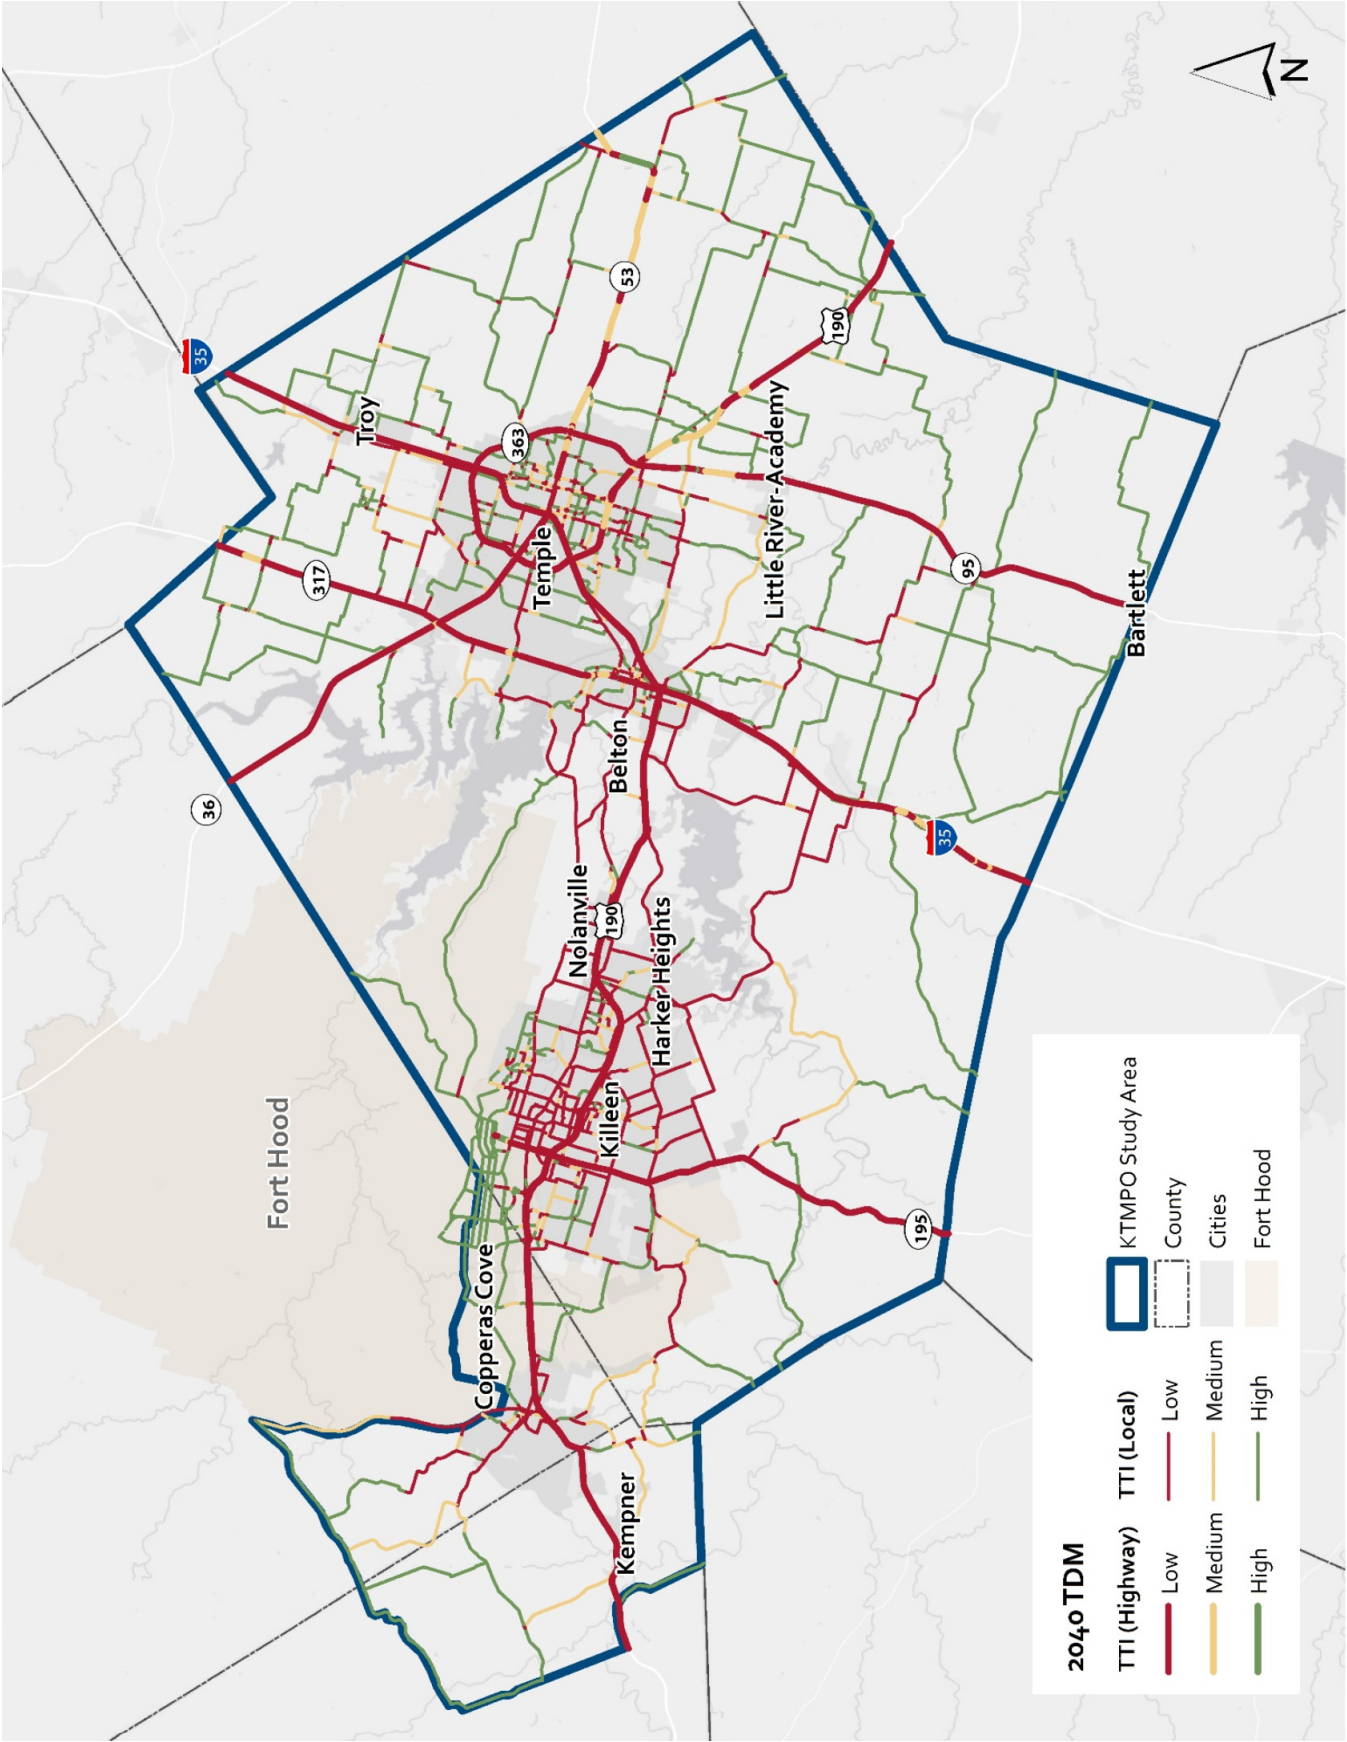

Data Conflation

Data conflation is the process of combining the different quantitative congestion data sets that have dissimilar geographic extents. Because the geographic information included with each dataset originated from different sources, it was necessary to aggregate the data into one geographic layer to ensure the results for each segment of the CMP were directly comparable.

The conflation process involved generating a buffer region around each segment of the CMP Network, then using GIS geoprocessing tools to use the buffer as a "catchment area" to collect the segments from each data source. Once the quantitative data was collected on one layer, the previously computed performance measures from Table 3-1 were compared for each data source. The complete inventory of performance measures for each CMP segment can be found in Appendix B.

The final step in the conflation process was to apply weights to the quantitative congestion performance measures and qualitative congestion data (from Google Traffic) to create a composite congestion score. The weights assigned to the congestion data are shown in Table 3-2. This score represents a weighted measure of congestion generated from the various different data sets, both quantitative and qualitative, that identifies congestion hotspots within the region. Figure 3-5 displays congestion hotspots determined by the number of data sources which indicate there is congestion for a particular segment.

Table 3-2: Congestion Score Data Weighting

	Number of Sources	NPMRDS	INRIX	TDM	Google	Total
All Sources	5%	20%	50%	20%	5%	100%
TDM + INRIX	5%		60%	30%	5%	100%
TDM + NPMRDS	5%	50%		40%	5%	100%
TDM Only	25%			70%	5%	100%

Figure 3-5: KTMPO Congestion Hotspots (All Sources)
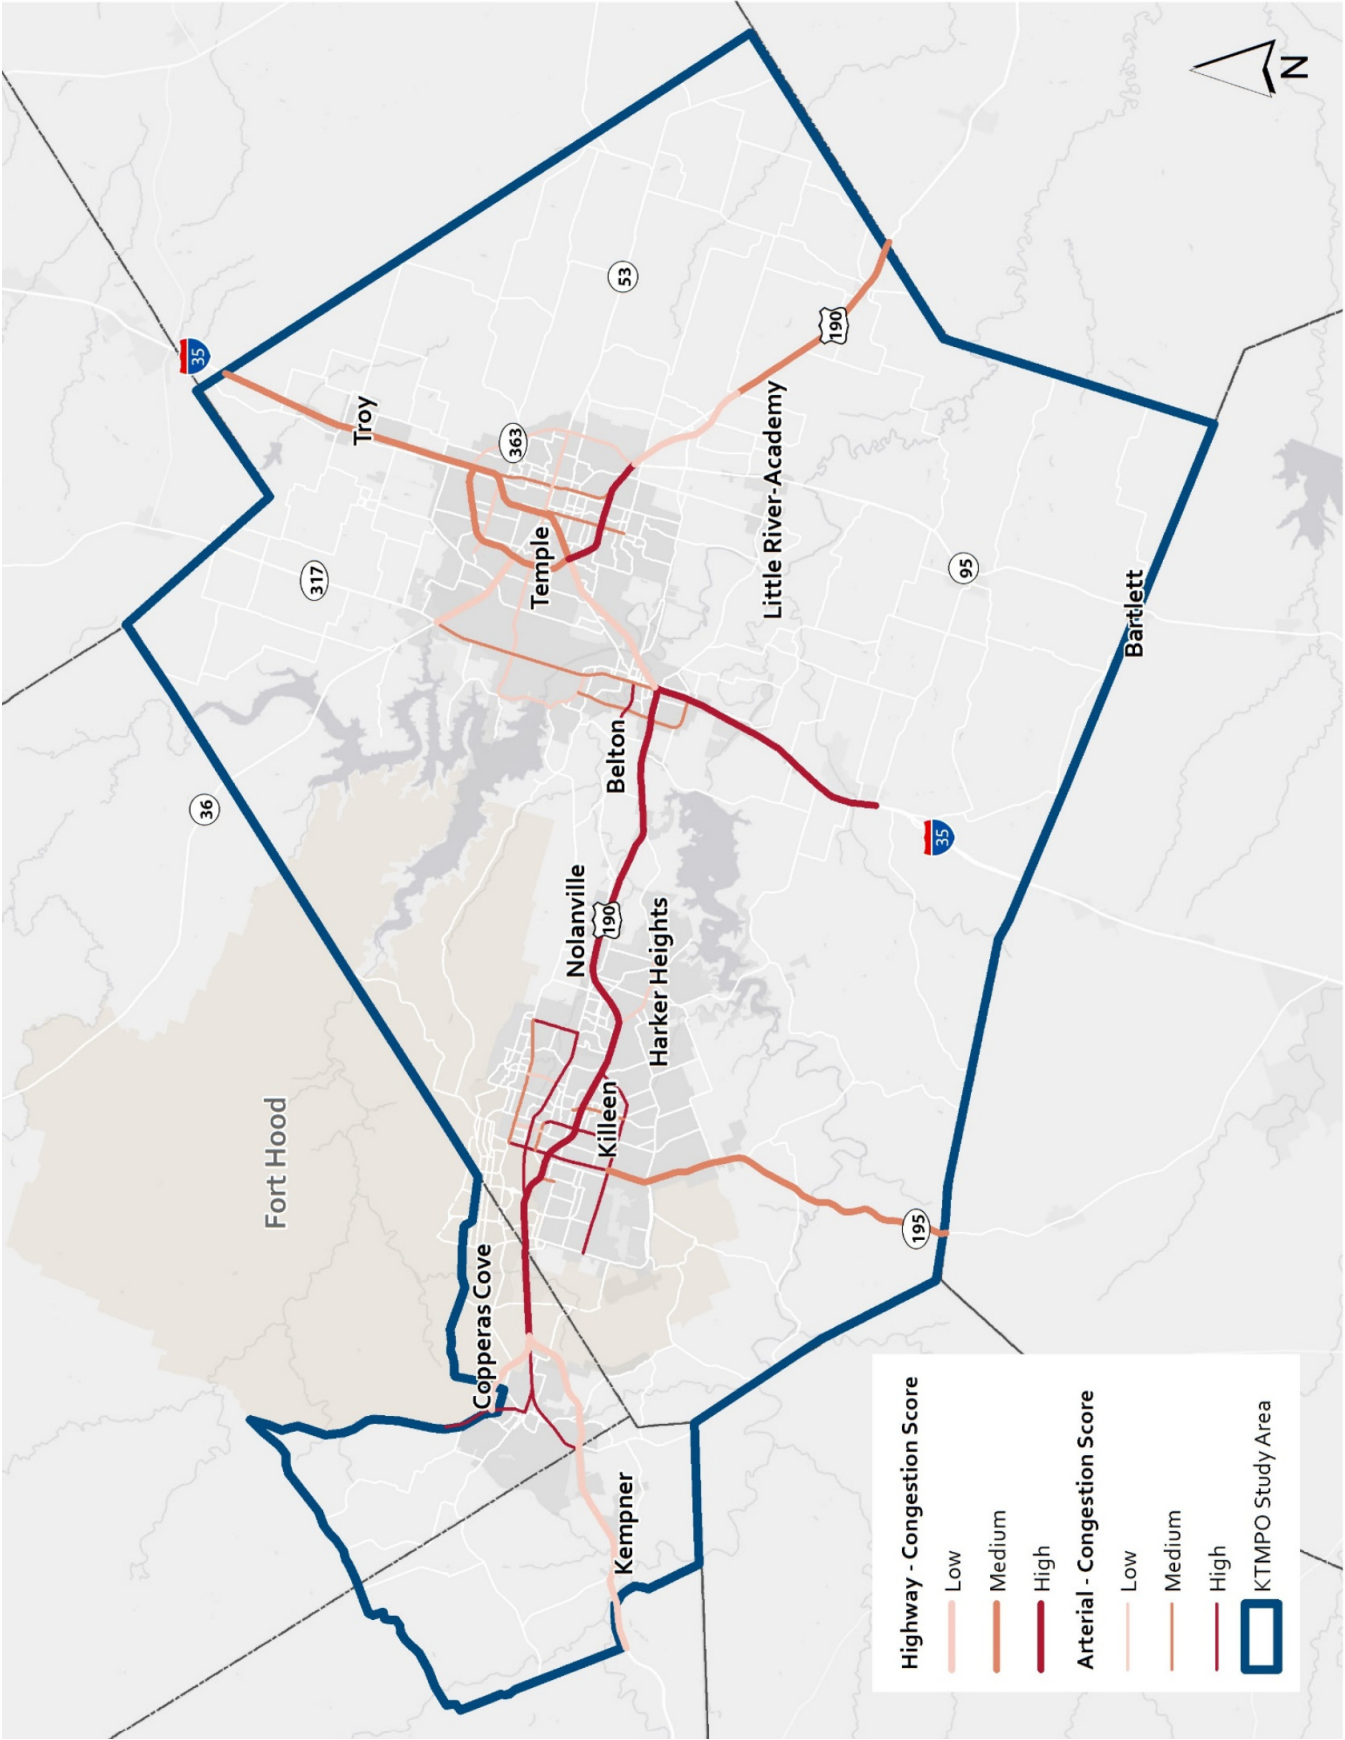

Prioritization Process

The data conflation process results in a combined measure of congestion that can be used to rank the segments of the CMP Network to determine the "worst" performing segments in terms of vehicle travel speed. However, the goals and objectives of the KTMPO CMP do not focus solely on speed data as the only means to target congestion mitigation strategies. For that reason, this 2016 CMP Update introduces a more robust congestion hotspot prioritization process that considers other elements of the transportation system as evaluation criteria to determine which congested hotspots should be the primary focus of congestion mitigation strategies in the region. The following section describes the elements of the prioritization process.

Congestion Score

As described in the section about data conflation, each segment of the CMP Network was given a congestion score that represents a weighted measure of congestion as determined through the quantitative and qualitative congestion data collected for the network. The congestion score was the most heavily weighted evaluation criteria used in the prioritization process.

Other Evaluation Criteria

The CMP uses the other evaluation criteria described in the following section to prioritize congestion hotspots in the region. The full results of the prioritization process, including tables detailing the values assigned for the evaluation criteria for each segment, can be found in Appendix B.

Traffic Volume

Using traffic volumes in the prioritization process allows the CMP to consider not only the severity of congestion on each segment, but also the magnitude of the congestion (i.e. how many people are affected by congestion). The volume data used in the prioritization process was taken from the Travel Demand Model, and represents the average flow along all TDM links within a segment.

Safety

One of the primary goals of the CMP is to facilitate the movement of people and goods in a safe manner. Therefore, safety was a major consideration in the prioritization process for the 2016 CMP Update. There were two evaluation criteria related to safety that were used to rank the congested hotspots:

- **Crash Rate** – The prioritization process uses the number of crashes normalized by the volume of traffic along each roadway in the CMP Network to prioritize congestion hotspots. The goal of including the crash rate is that segments with higher occurrences of crashes will receive higher priority so that future projects aimed at addressing congestion on that segment may also reduce crash rates.
- **Rear End Crash Rate** – In addition to considering the overall crash rate, the prioritization process also considers the percentage of crashes that are rear-end collisions. Rear end crashes could correspond to a higher prevalence of congestion where motorists may unexpectedly encounter congestion-related queues.

School Locations

The location of schools along the CMP Network may influence congestion due to the concentrated nature of school-related trips. The inclusion of school location in the prioritization process ensures that congestion hotspots that may either be affected by the presence of schools, or that may affect safety or access to schools in the region can be prioritized.

Transit Routes

Congestion along the CMP Network affects fixed-route buses in the Killeen-Temple area as much as it affects automobiles. Because the speed and travel time data available does not make any accommodation for the adverse impacts of congestion on public transportation, the prioritization process uses the presence of transit routes on CMP Network segments to ensure that congestion hotspots that affect transit vehicles are considered a higher priority for regional congestion reduction goals.

Public Need Identification

Finally, the prioritization process makes use of the public congestion survey that KTMPO produced at the beginning of the 2016 CMP Update process. Segments which survey respondents listed as congested with the highest frequency will receive greater priority in the final list of ranked congestion hotspots. Including the survey results in the process also ensures that KTMPO strongly considers public input when identifying congested locations in the region.

Evaluation Criteria Weighting

The process of determining weights for the evaluation criteria used to prioritize congestion hotspots was accomplished collaboratively with the project team, KTMPO staff, and members of the KTMPO Technical Advisory Committee (TAC). The TAC was presented with an initial list of recommended weights determined by the team in consultation with staff, and were given the opportunity to provide direct feedback on the criteria and initial weights at their July 6, 2016 meeting. The team also delivered an interactive spreadsheet tool that was distributed to both KTMPO staff and TAC members that allowed those surveyed to manually adjust the weights for each criteria and compare the shift in rank of each CMP Network segment that resulted with each change to the criteria weights.

After gathering feedback from the TAC, the project team revised the initial weights, and presented the revised weighting mix and resulting prioritized hotspot list back to the TAC at a meeting on August 3, 2016. After a final round of discussion and weighting adjustment, the TAC recommended that the Policy Board adopt the weighting mix shown in Table 3-3. The Policy Board approved the final evaluation criteria weights and resulting hotspot rankings on August 17, 2016. The complete prioritization matrix showing scores for each criteria on all segments of the CMP Network can be found in Appendix B.

Table 3-3: Final Evaluation Criteria Weighting

Criteria		Weight
Congestion Rank		30%
Volume		20%
Safety	Crashes	15%
	Rear-End Crashes	10%
Transit		15%
School		5%
Public Input		5%
Total		*100%*

Prioritized Hotspot List

Table 3-4 and Table 3-5 show the congested segments of the CMP Network, ranked based on the results of the prioritization process. The list is separated into highway and arterial elements of the CMP Network. The list represents a snapshot of the highest priority congestion hotspots along the transportation network in Killeen-Temple based on the data available during the 2016 CMP Update. As KTMPO continues to acquire data and update other regional planning documents, the evaluation criteria and weights used to sort this list should be revisited to ensure that the CMP continues to reinforce current planning efforts in the region.

4. Congestion Mitigation Strategies
The CMP is a tool to be utilized in the KTMPO region to address persistent congestion problems and prioritize transportation investments. There are many congestion management strategies and these strategies differ in terms of effectiveness, cost, complexity, and difficulty of implementation. Congestion management strategies are not one size fits all. Congested roadways and intersections need to be properly examined to evaluate which congestion mitigation strategy will effectively improve the congestion related problems. The CMP framework identifies numerous congestion mitigation strategies that can individually or collectively improve the operational efficiency of the KTMPO transportation system. When suitable strategies are implemented, the improvements impact auto, transit, pedestrian, and bicycle usage. The following sections identify several proven congestion management strategies that can be used to mitigate congestion in the KTMPO region.

Identifying Strategies

The mitigation strategies presented in the following section were selected based on their appropriateness for the KTMPO region and address congestion from a variety of angles. New infrastructure, infrastructure optimization, technological efficiency improvement, non-motorized improvement, and non-infrastructure program strategies have been considered for this plan. These strategies confront congestion at multiple scales so as to address deficiencies at specific locations as well as region-wide. Some strategies are more appropriate for highway projects, while others are more appropriate for arterial road projects.

How well each strategy can effectively mitigate operational, intersection, and capacity deficiencies depends on the specifics of each situation. There is no single best strategy for mitigating congestion. Instead, areas prone to congestion need to be reviewed on a case-by-case basis, and the most appropriate strategies for each situation need to be selected. This plan provides a toolbox of strategies that are already being used in the KTMPO area, as well as additional strategies that are being implemented in similar areas.

New Infrastructure

New infrastructure strategies, such as building new roadways, are typically used to significantly increase capacity in areas with high congestion. New infrastructure strategies typically do not aid in relieving non-recurring congestion, which accounts for about half of all congestion (FHWA, 2015). Non-recurring congestion, such as construction work, weather, and special events should be addressed by other means. Building new infrastructure can also be much more cost-intensive than improving existing infrastructure or operations, especially if new right-of-way must be procured.

Constructing Park-and-Ride Facilities

Park-and-ride facilities allow easy integration of multiple transportation modes and help facilitate the use of alternative transportation to and from areas with high traffic volumes. Motorists can leave their cars at the facility, then use transit to complete their journey. This relieves the motorists from the burden of finding parking at the final destination and can provide a more pleasant commute experience compared to driving in congested traffic.

Passenger Rail

Passenger rail can more efficiently move greater numbers of travelers further distances and relieve congestion between major destinations. Passenger rail is not likely to be an appropriate short-term strategy for the KTMPO region, but may become feasible as the region continues to grow and if KTMPO's transportation planning processes identify rail transportation as a regional preference.

New SOV Lanes

Additional single occupancy vehicle (SOV) lanes can be added to existing roadways and create additional capacity when necessary. While additional SOV lanes may address capacity deficiencies and relieve congestion in the short-term, studies have shown that they may also incentivize automobile trips to the point that the additional capacity is quickly occupied and congestion recurs shortly after expansion is complete (a phenomenon known as "induced demand.")

New Location Roadways

New location roadways create connections between popular destinations and relieve congestion in other areas. Particular attention should be paid to right-of-way preservation for identified new-location roadways as the area develops.

HOV Lanes

Incentivized capacity increases can reduce the number of SOVs on the roadway and reduce congestion. Only vehicles with multiple passengers may use HOV lanes, which are typically less crowded than other travel lanes. The possibility of a faster commute may encourage more people to carpool, reducing the number of cars on the road and, subsequently, congestion.

Infrastructure Operations

Strategies to improve infrastructure operations can significantly enhance the efficiency of the transportation system. These strategies are designed to allow more effective management of the supply and use of existing roadway facilities. Infrastructure operations strategies can effectively increase capacity without construction of additional general purpose lanes. These strategies typically have a lower cost, can be implemented faster, and require less right-of-way compared to new infrastructure mitigation strategies.

Access and Driveway Spacing

Steady traffic flows are more easily maintained when access points and intersections are spaced further apart. This strategy can also reduce conflict points with pedestrians and other roadway users. Similarly, wider driveway spacing can improve traffic flow and reduce the number of merging conflict points along roadways.

Median Treatments

Non-traversable and raised medians, as well as two-way left-turn lanes (TWLTL), can regulate access to a roadway and reduce the number of crashes.

Right-of-Way Management

Maintaining and preserving existing right-of-way makes it easier to make future roadway improvements, as the region grows and roadway enhancements become more necessary.

Highway Geometric Improvements

Improvements to highway geometry can reduce crashes and improved traffic flows.

Wayfinding and Signage Improvements

Clearly marked streets and wayfinding can help maintain steady traffic flows and direct vehicles down the most appropriate routes.

Transit Fixed Route Operations

Fixed route transit services, such as additional bus routes, can provide a more predictable and reliable service to transit users and encourage others to begin using this service instead of driving. The presence of transit service has the effect of increasing total capacity of a roadway due to the more efficient utilization of space needed to move several people by a bus or transit vehicle compared to several single-occupant automobiles.

Intersection Turn Lanes

By separating turning traffic from through traffic, movement can be maintained and the number of vehicle conflicts can be reduced.

Grade Separated Railroad Crossings

Grade separation can improve safety and reduce the amount of queued traffic caused by long trains.

Roundabout Intersections

Roundabouts can help facilitate a continuous flow of traffic and reduce the number of conflicts in an intersection. By reducing the amount of stop and go traffic, roundabouts can also improve air quality and reduce noise.

Acceleration/Deceleration Lanes

Additional lanes for accelerating or decelerating allow for vehicles to safely match speeds with other vehicles before merging.

Hill-Climbing Lanes

Hill-climbing lanes allow for safe passing of slower vehicles while ascending hills.

Grade-Separated Intersection

The separation of grades at intersections can reduce vehicle conflicts where crashes are more likely to occur.

Designated Truck Routes

Diverting commercial and truck traffic to designated roads can limit congestion, air pollution, and noise along those roads, while potentially relieving congestion on other roads.

Bus on Shoulder System (BOSS)

A bus on shoulder system allows for buses to operate on shoulders to bypass traffic. This frees up space on the roadway for other vehicles but also provides a higher level of service to transit users.

Bus Pullouts

Bus pullouts allow for buses to move off of the street when picking up or dropping off passengers, which prevents the disruption of traffic flow for automobile users on a roadway. Care should be taken when implementing bus pullouts that the transit vehicle is able to re-enter the flow of traffic in a reasonable way, which is typically accomplished through some sort of transit signal that stops automobile traffic once the transit vehicle is ready to leave the pullout.

Bottleneck Removal

By correcting and removing physical limitations that form capacity constraints, traffic can flow more freely without backing up.

Technological Efficiency Improvement

Technological efficiency improvement strategies utilize modern technology and computing capabilities to improve efficiency and operations in the existing transportation system. These strategies typically involve using sensors to collect and process data about traffic conditions. Information about traffic conditions can be directly presented to commuters in the form of electronic signage so that they can make travel decisions based on current conditions. The information can also be used to manipulate traffic operations based on current demands. Technological efficiency improvement strategies can effectively increase a transportation system's capacity without requiring costly and time-consuming construction.

Ramp Metering

Ramp metering maintains incoming and outgoing traffic flows to and from highways and can help manage high-traffic areas efficiently.

Traveler Information and Rerouting Systems

Through a system of communication means, such as electronic signs, traffic can be directed along alternative corridors when other corridors become congested.

Electronic Commercial Vehicle Clearance and Tolls

These tolls regulate the flow of commercial vehicles so as to reduce the freight demand on certain roadways during periods of high demand.

Bluetooth-Based Travel Time Measurement

Accurate travel-time estimates can help motorists make decisions on which routes to take and when to take them.

Route Information

By informing people about current travel conditions and recommended routes/detours, congestion can be avoided.

Traffic Signal Optimization

Optimizing timings and sensors for location specific needs can help maintain traffic flows.

Transit Signal Priority

By giving transit services priority at traffic signals, transit services can be improved and incentivized as a viable mode of transportation.

Demand-Responsive Signal System

Traffic signals modify timings based on traffic demand and help to maintain traffic flows when the transportation system is under heavy load.

Transit Vehicle Tracking

Tracking the exact locations and arrival times of transit vehicles can improve the user experience and incentivize transit use.

Non-Motorized Improvements

Non-motorized improvement strategies typically involve improving or creating new infrastructure that more effectively facilitates the use of active transportation. Active transportation includes modes such as walking or biking. Encouraging and facilitating active transportation can help reduce the number of trips made by single occupancy vehicles, thus reducing congestion on roadways. According to the National Travel Household Survey (2009), about half of all trips in metropolitan areas are three miles or less and about 28% of all trips are one mile or less. These distances can easily be made by bicycle or on foot, but 65% of trips one mile or less are made by automobile. Capacity improvements for non-motorized transportation often have no effect on motorized transportation capacity but can decrease the demand for motorized transportation. Non-motorized improvements can also improve safety conditions and reduce conflicts for people who currently already use active transportation.

Bicycle Paths/Lanes

Additional bicycle lanes/paths can improve safety for those who travel by bicycle and help to facilitate the use of bicycles to replace shorter trips usually taken by cars.

Sidewalks

Sidewalks along roadways can improve the safety conditions for pedestrians and help reduce conflicts between pedestrians and motorists.

Pedestrian Signals

Pedestrian signals can help to improve pedestrian safety as well as reduce conflicts at intersections.

Bicycle Racks

Secure, safe, and convenient bicycle parking options can encourage more cycling and reduce trips taken by car.

Safe Routes to School Program

This federally funded program helps to invest in and improve pedestrian and bicycle infrastructure near schools, allowing children and parents to use alternative modes of transportation to get to and from school.

Bike Sharing System

A network of bicycle rental stations allows for people to make short trips by bicycle. Bike sharing systems are good for resolving the "last mile problem," which refers to either the first or last leg of a transit trip that is often too far to walk. Bike sharing already exists in many cities across Texas and is seen as a good way to replace shorter car trips with bicycle trips.

Non-Infrastructure Improvement

These strategies often involve incentivized programs to help manage demand without the need to improve existing infrastructure or construct expensive new infrastructure. Some strategies can be directly implemented by a municipality or government, while others would be implemented by employers and incentivized through tax benefits. These strategies are often implemented region-wide to mitigate congestion rather than at specific locations and can be very low-cost.

Motorist Assistance Patrols

Special patrols can access accidents and stranded vehicles more quickly and get traffic moving again. An example of this is the HERO (Highway Emergency Response Operator) program, which operates in the Austin metropolitan area.

Strategies to Improve Accident Response and Clearance Time

Improved accident response and clearance times mean that accidents can be addressed sooner and normal traffic conditions can be restored more quickly.

Initiating and Managing a Rideshare Program

Ridesharing programs, which match employees that leave near one another to facilitate carpooling, can result in fewer cars on roads and less congestion, while also encouraging travelers to utilize an alternative mode of transportation.

Flexible Work Hours

Flexible work hours relieve stress on the transportation network during peak travel times by allowing people to commute to and from work at off-peak travel times.

Telecommuting

Telecommuting allows for people to work from home and reduces the number of trips between work and home during peak travel times.

Satellite Offices

Satellite offices can disperse jobs throughout a larger area, rather than in one office. This prevents concentrated congestion in one area.

Land Use Management

Controlling and regulating land uses can help control which types and how many trips are being made in specific areas. Managing growth and development can directly impact

the transportation system as well as influence how commuters select their travel mode. Implementing land uses that contain a mix of residential, retail, and employment can improve the feasibility of conducting trips by walking or biking, therefore reducing automobile demand on congested corridors.

Commuter Choice Tax Benefits

Employers can provide incentives and discounted transit passes to encourage transit use in exchange for tax benefits.

HOV Toll Savings

Preferential pricing for multi-occupant vehicles on toll roads incentivizes ridesharing, which can again reduce the number of cars on the road at a particular time.

Parking Management

Preferential parking for vehicles that carry more than a single occupant can encourage ridesharing.

Driver Education

Driver education programs can inform drivers about choices that are available to avoid and reduce congestion.

CMP Strategy Toolbox

Table 4-1 displays the "toolbox" of strategies for the KTMPO region to consider when managing congestion. The toolbox includes several attributes for each strategy to help local policy-makers and transportation planners assess the applicability of each strategy to particular types of deficiencies/congestion in the region (columns 2 through 4). Columns 5 through 10 provide information about each strategy in terms of implementation period, inclusion in the 2013 CMP, and appropriate facility type for implementation: highway, arterial, or strategies that are not dependent on any particular location but are instead regional in extent (typically strategies that address demand management).

Table 4-1: CMP Strategy Toolbox

Strategies	Operational Deficiency	Intersection Deficiency	Capacity Deficiency	Short Term Strategy	Long Term Strategy	Included in 2013 Plan	Highway Strategies	Arterial Strategies	Regional Strategies	Cost

Evaluating Strategy Effectiveness 4-9

The 2016 CMP update provides KTMPO with a prioritized list of congested roadway segments in the region, as well as a list of strategies that can be considered in future planning studies that may address congestion in those hotspot locations. This update also takes the initial step of assessing the effectiveness of each of these strategies towards addressing the particular congestion problems identified during data analysis. The matrices in Tables 4-2 through Table 4-4 show whether a highway or arterial congestion mitigation strategy is likely to be effective, marginally effective, or not applicable to each segment of the CMP Network. As the priorities and travel patterns in the region continue to change, new projects are implemented, and new mitigation strategies are identified, these matrices will be updated to reflect the most up-to-date assessment of how the region can best address its congestion needs. It should also be noted that these recommendations are no substitute for detailed corridor-level analyses, which will be necessary to conduct before any specific projects can be advanced through the region's Metropolitan Transportation Plan (MTP) and Transportation Improvement Plan (TIP) planning and implementation processes.

Table 4-2: CMP Strategy Effectiveness (Highways)

5. Plan Monitoring and Performance Tracking

> **"...the most important element of the CMP is the Monitoring Plan..."**

The Congestion Management Process is intended to be a dynamic guidebook for tracking progress towards the region's congestion management goals. As such, the most important element of the CMP is the Monitoring Plan, which guides the MPO through the process of tracking and reporting performance on the CMP Network and assessing progress made towards congestion reduction.

The general steps required to carry out an effective monitoring program for congestion management are:

1. Maintain and update the designated CMP network
   a. Evaluate available data sources to determine any expansion in coverage
2. Identify locations where CMP projects have been implemented and document these segments in the appropriate GIS layer
   a. Identify the strategy within the strategy matrix that each project implements
3. Obtain selected monitoring datasets from TxDOT or other available sources
4. Use the performance monitoring datasets to evaluate the CMP network performance
5. Document outcomes, particularly at locations where transportation investments have been made, to determine performance improvements or identify challenges remaining to be addressed

The first two steps in the monitoring plan are straightforward and are not expanded upon in this chapter. The following sections describe the data sources, processing, and outcome documentation that KTMPO should implement to monitor system performance.

Step 3: Obtain Performance Data

As discussed in Chapter 2, thanks in large part to the proliferation of smartphone data, there are now a number of travel time data sources available to KTMPO through its planning partners. In monitoring system performance, KTMPO should seek to acquire the following data sources:

○ **National Performance Management Research Data Set (NPMRDS)** – The NPMRDS is readily available through TxDOT and delivered in a manner that is fairly user-friendly. As the official data source used by FHWA to calculate Federal performance measures, the NPMRDS also provides KTMPO with technical support from FHWA. Unfortunately, data coverage is limited to roadways on the National Highway System. At the time of the 2016 CMP Update, FHWA was in the process of re-procuring the NPMRDS, so in upcoming years there may be changes to the format of the data.

○ **INRIX** – INRIX is a private travel data company that collects data and sells it to interested parties. In this case, TxDOT has partnered with the Texas A&M Transportation Institute (TTI) to purchase data from INRIX and have TTI process the data to produce the annual list of the top 100 congested roadway segments

in the state. TxDOT makes the processed data available to MPOs, and the coverage of the data in KTMPO includes most of the roadways on the CMP Network.

o **KTMPO Regional Travel Demand Model** – KTMPO may seek to supplement the observed travel time datasets with forecast travel information produced by the regional Travel Demand Model. The TDM is typically updated every four to five years when the MPO prepares updates to the Metropolitan Transportation Plan. The TDM should be used to supplement information from primary sources, but not to replace them because it does not contain observed data, only forecasts of possible future transportation scenarios.

o **Google Traffic** – The MPO may also supplement the quantitative data with observations from the typical traffic layer available in Google Maps. KTMPO can collect the data qualitatively from the web in a process described in the following section or may contact Google directly to inquire about data availability for public sector users and transportation planning purposes.

o **Bluetooth** – Bluetooth detectors are currently operational only along IH 35 through the KTMPO region. However, as Bluetooth technology increases in breadth and accuracy, KTMPO may partner with local jurisdictions and TxDOT to acquire and install Bluetooth detectors along key routes in the CMP Network that may not be covered by the other available quantitative data sources.

Source: Michael Miller; FME News Service

Step 4: Evaluate CMP Network Performance

This section briefly describes the process for taking data from the most readily available datasets and converting it into a format where performance measures can easily be recorded. Data processing for any other dataset that the MPO may obtain should be a key consideration in determining whether the MPO should pursue additional data.

NPMRDS

Data processing for the NPMRDS is relatively straightforward given the partnership between the data collection company (HERE) and FHWA. The data file given to KTMPO by TxDOT includes several PDF guides to help the MPO process the data and connect it to the regional roadway system in GIS. The major steps in the process are as follows:

o *Process Raw Travel Time Data* – the travel time data is delivered for reporting segments – known as Traffic Messaging Channels (TMCs) – for every 30 second period throughout the reporting period (typically data files are delivered monthly). This raw data travel time data can be aggregated into 15-minute average speeds for file size management, and during the aggregation process, outliers can be removed.

o *Compute free-flow travel speed* – with the raw data, the user can also compute the 85th percentile travel speed, which is used as the freeflow travel speed for each TMC.

o *Compute performance measures* – once the 15 minute averages and freeflow speeds are determined, the TTI and Delay measures can be computed. Refer to the table in Chapter 3 for the calculation methods for each performance measure.

○ *Connect performance measure calculations to geographic data* – the process for joining the performance data to the shapefile is explained in detail by the guidebook provided by FHWA that accompanies the data.

INRIX

In the file format that TxDOT provides INRIX data to its planning partners, most of the data processing has already been accomplished. The data deliverable contains a spreadsheet that has 15-minute average travel speeds and freeflow travel speeds already computed for each RHiNo segment, and a shapefile with the RHiNo segments for all roadways in the region. The MPO can use the 15-minute and freeflow speed data to compute the TTI and Delay performance measures. Additional delay measures outlined in Chapter 3 are available in another spreadsheet, which contains the performance measures calculated by TTI for the Texas 100 Most Congested Roadways. Note that the Texas 100 roadway network may not contain performance data for as many roadways as may be available through the 15-minute spreadsheet. The data deliverable also contains a guidebook that the MPO may use to join the calculated performance data to the provided shapefiles, although some care is advised to ensure that the directionality of the speed data aligns with the directionality of the shapefile.

Google Traffic

The first step to collect congestion data from Google Traffic is to identify a reference network (e.g. CMP Network) to determine which roads to evaluate. The network as a whole is split into manageable sections or cells that should roughly reflect the scale to which Google Maps is being viewed during the data collection. The scale in Google Maps should be defined so that all roads are easily identified—that is, roads do not overlap others to the point that the level of congestion cannot be deciphered—but it should not be zoomed in so far that the traffic overlay shows data for small local roads not a part of the analysis. A half-mile to one-mile scale in Google Maps should be sufficient.

The next step is to set up a data log which records a unique ID, street name, direction, and extent identified by closest cross street. Extent of each segment is different and does not necessarily have to be from one major road to another. The log should also include the specified time periods and days for which data is being collected. Once the congestion log is set up, the next step is to work cell-by-cell screening for congested segments. This process involves observing the Google Traffic overlay for each specified time period and day, taking note of where there is reoccurring congestion. Then, focusing in on one of the identified congested segments, record the segment description information in the data log and work through the different time periods recording the magnitude of congestion, based on the scale provided in Google Traffic. Once this process is completed for a segment, the process is repeated for other segments along the reference network in that cell. Before moving on to the next cell, screenshots of the full extent of the cell in Google Maps should be taken as a QC measure.

After all congested segments have been identified for the reference network, the collected congestion information is aggregated and brought into GIS. This is done by either creating a new shapefile and manually drawing in the congested segments based on Google base maps and the descriptions provided in the data log or by using the data log to approximately match the congestion data to a current network. The final product should include congested segments with associated attributes that describe the

magnitude and/or duration of congestion as specified by a given scale relative to the Google Traffic scale. The congested segments can then be compared with segments on the CMP Network to determine to what extent the CMP Network segments are congested.

TDM

Travel speed information is included in the outputs from the TDM. The TDM outputs also contain information about volume on the roadway network (referred to as "flow" in the TDM) that is used during the hotspot prioritization process.

Prioritization Data

In order to supplement the congestion data and calculate evaluation measures used during the prioritization process, the MPO should also collect data from the following sources:

- *TxDOT Crash Recording Information System (CRIS)* – This dataset provides crash location information in a format that is easily convertible to a shapefile that can be used to calculate the crash rates and rear-end crash rates along CMP Network segments.
- *Transit Availability* – The MPO may partner with Hill Country Transit District (HCTD) to obtain shapefiles containing current and/or future transit routes. If HCTD installs Automatic Passenger Counters in the future, it may also be possible to incorporate route- or stop-specific transit ridership data into the prioritization matrix.
- *School Location* – School location shapefiles are readily available through GIS providers such as ESRI, or through the State. The MPO may also partner with local school districts to obtain or create a school location shapefile for the region.
- *Public Input* – KTMPO may conduct a Congestion Survey at any time and use the responses to calculate the most frequently identified congested locations along the CMP Network.

Performance Measures

As listed in Chapter 2, the performance measures recommended for use in monitoring system performance are:

- Travel Time Index
  - Average Daily
  - Maximum
- Delay
  - Average Daily
  - Peak Period
  - Annual Hours of Delay
- V/C Ratio (Current and Future)
  - Average Daily
  - Peak Period
- Transit Availability
- Crash Rate
- Rear-end Crash Rate

Step 5: Documenting Performance Outcomes

Once performance measures have been calculated from the appropriate datasets, KTMPO should note year-over-year changes in each metric for each reporting segment of the CMP Network. This should result in a re-prioritization of the segments to determine what changes (if any) have occurred to the list of highest priority congested roadway segments. The MPO may choose to expand upon or re-weight the evaluation criteria used in the prioritization process to best align the process with current metropolitan planning goals and objectives.

While documenting performance changes, KTMPO should note which segments of the CMP Network had congestion mitigation projects implemented during the time since the last performance update (this should have been accomplished in Step 2 of the monitoring plan). Noting correlations between the types of strategies that are implemented and the changes in congestion performance will allow the MPO to develop metrics that predict the expected performance impacts for strategies in the CMP Toolbox.

For example, if one of the region's municipalities implements a signal re-timing project along several roadway corridors on the CMP Network, the MPO can record the changes in the TTI and delay on those corridors before and after the signal re-timing and develop an average improvement value that can be expected on similar corridors for which signal re-timing is an appropriate congestion mitigation strategy. Once specific projects are implemented, performance improvement metrics can be directly compared to project costs to identify the most cost-effective congestion mitigation strategies that are tailored to conditions in the region.

Conclusion

An ongoing monitoring program is one of the key steps in implementing the FAST Act performance management strategy. It not only allows KTMPO to identify emerging problems on the transportation system, but it also allows the MPO to measure the outcomes of transportation investment decisions to determine if the planning process is being effective in addressing local transportation challenges. Learning what works and doesn't work provides a basis for continuous improvement in the outcomes of the metropolitan planning process.

Congestion Survey Results Memo

KTMPO Congestion Management Process (CMP) | Survey Results

The congestion survey was designed to gather feedback on how travelers define and where they experience congestion in the Killeen/Temple metropolitan area (Fig. 1). This feedback was meant to supplement other quantitative/qualitative data sources in the process of identifying congested roadway segments and prioritizing which segments to focus congestion management efforts. The survey was open to the public from Feb. 29, 2016 to March 31, 2016 and received 222 responses. The following briefly summarizes and presents the results from the congestion survey.

Fig. 1: Killeen/Temple Metropolitan Area
In regards to overall congestion (i.e. Question 1 of the survey), 90% (200) of the respondents who answered the question agreed that traffic congestion was a significant problem in the Killeen/Temple metropolitan area. Since the definition of what is considered to be congestion changes from place to place, it was important to identify how Killeen/Temple travelers locally defined congestion. Fig. 2 illustrates the survey responses that helped to answer this question.

Fig. 2: Responses to survey Question 2 - Which of the following best fits your definition of traffic congestion?
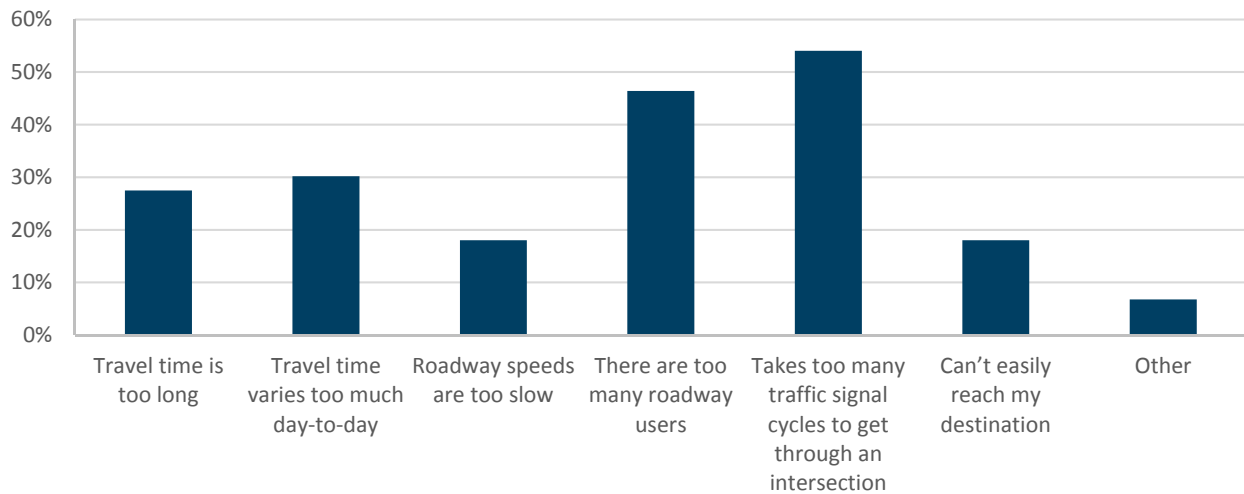

Respondents to this question were given the option to select multiple answers, and 54% included "Takes too many traffic signal cycles to get through an intersection" in their definition of traffic congestion. This definition of congestion was agreed upon the most, while 46% believed traffic congestion in the area was defined as there being "…too many roadway users".

Additionally, survey respondents identified the causes of this type of traffic congestion. The biggest culprit for traffic congestion in the area, as pointed out by 54% of the respondents, was roadway construction—with inadequate roadway capacity (47%) and ineffective/poorly timed traffic signals (43%) being the next most identified causes of congestion. Fig. 3 presents the full results for the question linked to these answers; respondents were allowed choose multiple answers.

Fig. 3: Responses to survey Question 3 - What do you perceive are the biggest causes of traffic congestion in the Killeen/Temple metro area?
Looking at the frequency to which travelers experienced congestion in the area, 62% claimed to experience congestion daily during peak travel periods (7AM-9AM and 4PM-6PM). Fig. 4 provides the full results for determining the frequency in which respondents experienced congestion.

Fig. 4: Responses to survey Question 4 - How often do you experience traffic congestion in the Killeen/Temple metro area?
In terms of identifying where on the roadway network travelers were experiencing the most congestion (i.e. survey Question 5), the following table shows the top three most mentioned intersections and road segments.

Table 1: Responses to survey Question 5 - Worst Congestion Locations (Current)

Intersection	Mentions	Segment	Mentions
WS Young @ US 190	19	W. Adams Ave. (Temple)	19
FM 2410 @ US 190	15	WS Young Dr. (Killeen)	10
Trimmier Rd @ US 190	11	Trimmier Rd. (Killeen)	9

IH-35, in general, was also mentioned frequently by the respondents as being most heavily congested.

While it was crucial to understand how the community defines and where/how they experience congestion, it was also beneficial to understand more about the respondent's travel behavior. For instance, in response to Question 7 of the survey, 98% of the respondents reported that they travel in a personal car most often. Only one person of the 218 who answered the question reported taking an alternative mode of transportation (i.e. carpool). Looking at travel patterns, Figures 5 and 6 show which zip codes respondents travel from (i.e. where they live) and which they travel to most frequently (i.e. where they work). The following were the most frequently reported pairs of zip codes, including the number of mentions, in terms of origin and destination:

- ☐ 76513 – 76513 (13)
- ☐ 76502 – 76513 (10)
- ☐ 76502 – 76502 (10)

Fig. 5: Responses to survey Question 8 - In which zip code do you live?
Fig. 6: Responses to survey Question 9 - To which zip code do you travel to the most?
The frequency of the mentioned zip code pairs reveals that the most common trip of the respondents is contained within the Belton/Temple area. However, it should be pointed out that these are relatively large zip codes that may capture more responses simply because of their size. Also, there were several zip codes respondents reported to travel to outside of the metro area, but no more than two people did so for each of those zip codes.

In response to Question 10 about how long it takes to get to a most frequent destination, on average, respondents stated that this type of trip would take about 15 minutes without traffic. However, in response to Question 11, they reported to need about 15 extra minutes to reach their most frequent destination on time while accounting for traffic congestion. In the worst case, up to one hour of extra time was needed.

In order to avoid congestion, respondents reported (in response to Question 12) that they would most likely leave at a different times (83%) or take alternative routes (66%). Fig. 6 provides the full results showing what decisions travelers in the Killeen/Temple metro area make to avoid congestion. Furthermore, respondents believed that the most effective strategies for addressing congestion in the metro area, in order of most reported, were to improve traffic signal coordination (59%), increase

roadway capacity (58%), and implement dedicated turn lanes (43%). The full results are shown in Fig. 8

Fig. 7: Responses to survey Question 12 - What actions do you take to avoid traffic congestion?
Fig. 8: Responses to survey Question 13 - What do you believe are the most effective strategies for addressing traffic congestion in the Killeen/Temple metro area?
Overall, the respondents of this survey are reliant on their personal vehicles to mostly travel relatively short local trips within Killeen, Belton, or Temple. During these trips, respondents typically experience around 15 minutes of delay when traveling during peak periods—most often a result of bad traffic signal timing or roadway construction. Congestion is reported to be concentrated at important arterial/collector roads that connect with either US 190 or IH-35. Many of the respondents leave earlier or later than they normally would or search for alternative routes in order to avoid congestion and ensure they reach their most frequent destination on time. Many of the respondents believe the congestion issues of the metro area could be addressed with better traffic signal coordination and increased roadway capacity.

KTMPO Congestion Survey Questions

1. Based on your daily travel experience, do you believe traffic congestion is a significant problem in the Killeen/Temple metropolitan area?

    ☐ Yes

    ☐ No

2. Which of the following best fits your definition of traffic congestion? (Select up to 3)

    ☐ Travel time is too long

    ☐ Travel time varies too much day-to-day

    ☐ Roadway speeds are too slow

    ☐ There are too many roadway users

    ☐ Takes too many traffic signal cycles to get through an intersection

    ☐ Can't easily reach my destination

    ☐ Other _____

3. What do you perceive are the biggest causes of traffic congestion in the Killeen/Temple metro area? (Select up to 3)

    ☐ Inadequate roadway capacity

    ☐ Ineffective/poorly timed traffic signals

    ☐ Lack of dedicated turn lanes

    ☐ School zones

    ☐ Roadway construction

    ☐ Inclement weather

    ☐ Lack of alternative transportation options (e.g. transit, bicycle lanes, etc.)

    ☐ Lack of alternative route options

    ☐ Crashes/traffic incidents

    ☐ Special Events

    ☐ Slow-moving/freight vehicles

    ☐ Other _____

4. How often do you experience traffic congestion in the Killeen/Temple metro area? (Select 1)

    ☐ Daily – regularly, during peak travel periods (7AM-9AM and 4PM-6PM)

    ☐ Daily – regularly, during off-peak travel periods

    ☐ Daily – intermittently/sporadically

    ☐ A few times a week

☐ A few times a month

☐ Other _____

KTMPO Area Streets
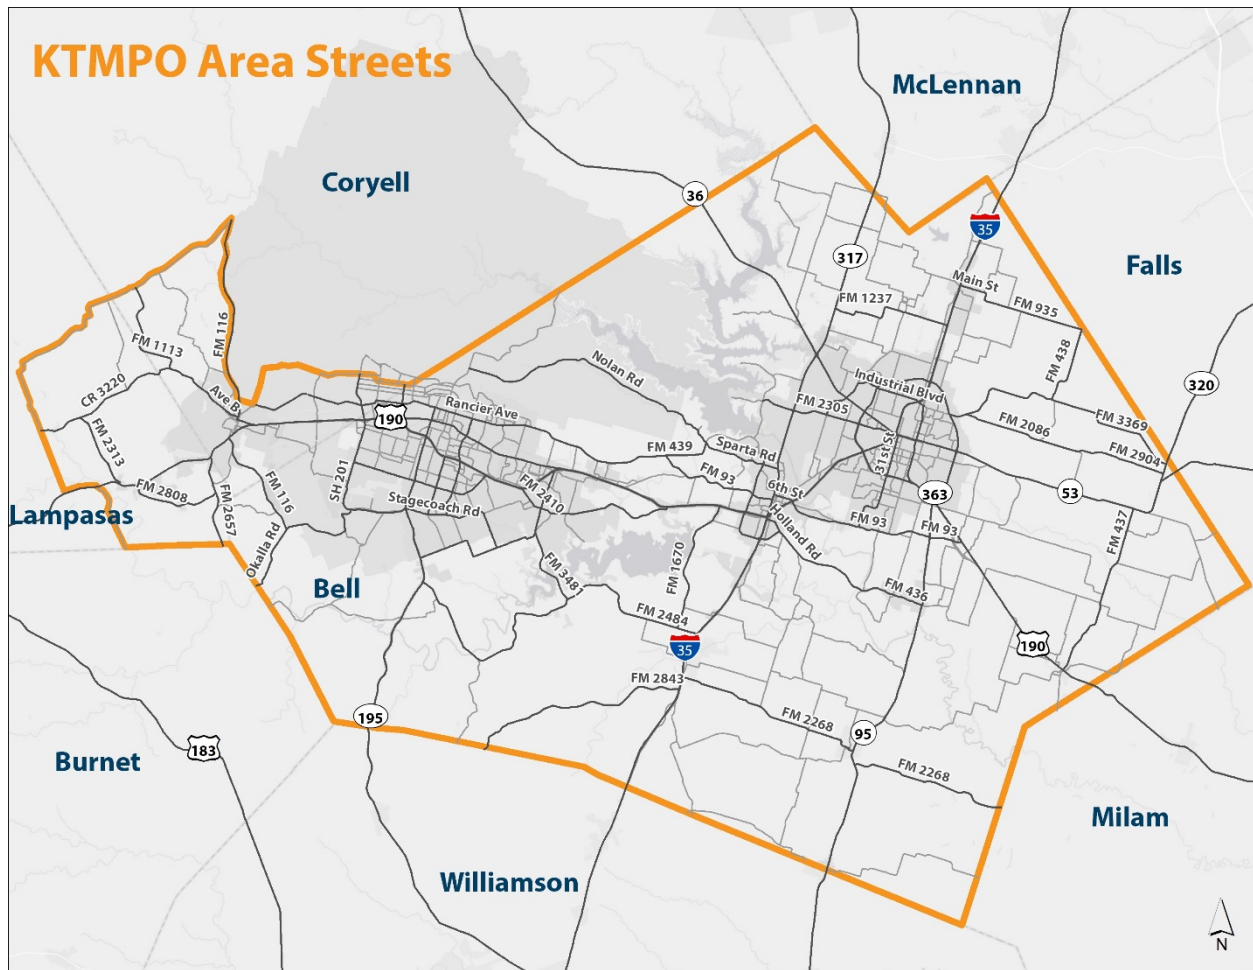

5. Using the map and/or the blanks below, locate three (3) road segments or intersections in the Killeen/Temple metro area where you believe congestion is currently the worst.

_____

_____

_____

KTMPO Area Streets
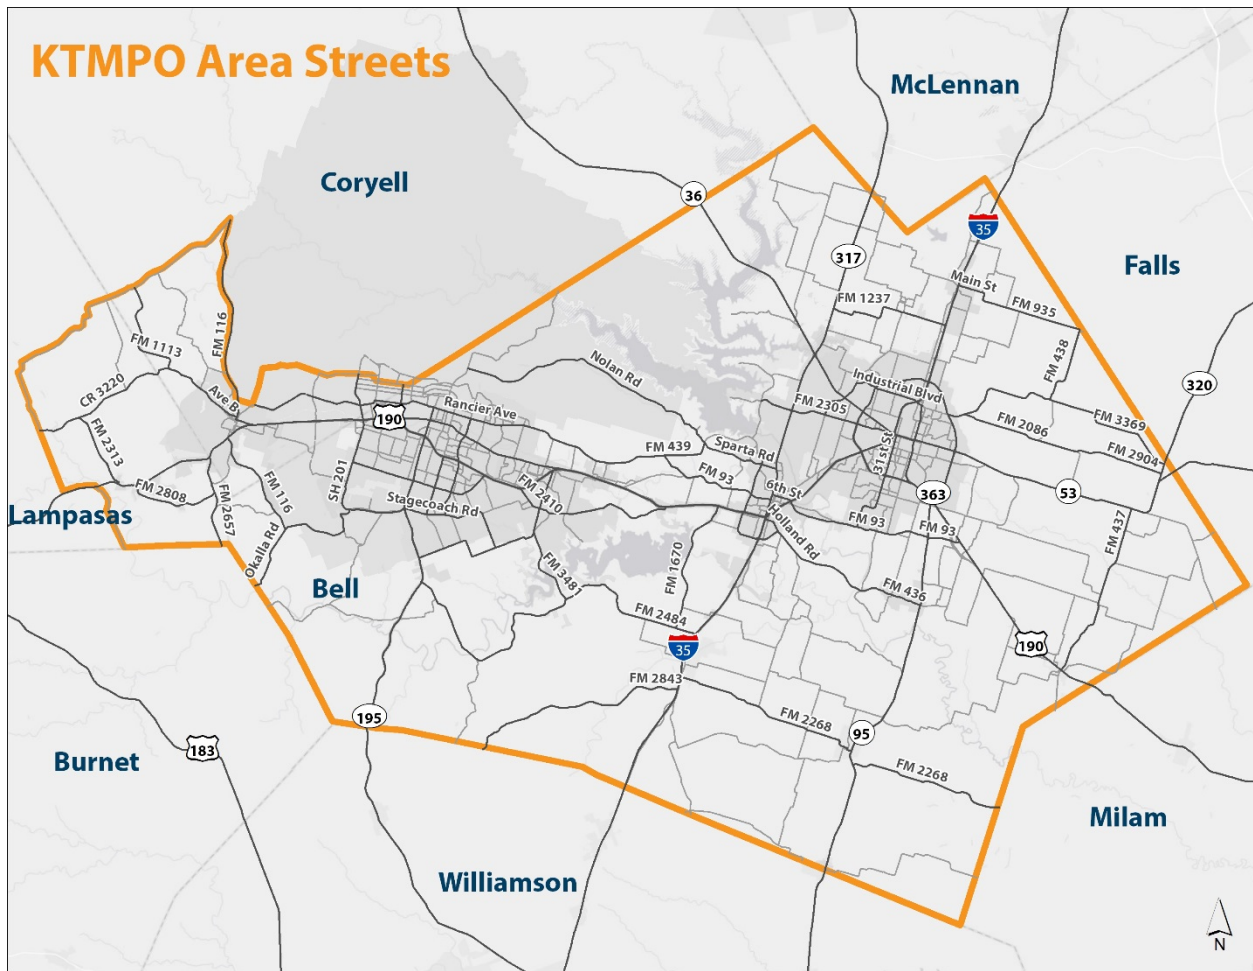

6. Using the map or the blanks below, locate three (3) road segments or intersections in the Killeen/Temple metro area where you think congestion will be the worst in 10 years.

_____

_____

_____

7. What mode of transportation do you use most often? (Select 1)

- ☐ Personal car
- ☐ Public Transportation
- ☐ Walking
- ☐ Biking
- ☐ Carpool/Rideshare
- ☐ Other _____

8. In which zip code do you live? _____

9. To which zip code do you travel to the most (for work, school, etc.)? _____

10. How long would it take (in minutes) to get to your most frequent destination (e.g. work) from home with no traffic congestion?

_____

11. How much extra time do you allow yourself (in minutes) to get to your destination on time to account for traffic congestion along your route?

_____

12. What actions do you take to avoid traffic congestion? (select any that apply)

- ☐ Leave earlier or later than you normally would for certain trips
- ☐ Take public transit
- ☐ Walk/bike
- ☐ Take alternative routes
- ☐ Not travel (e.g. work from home)
- ☐ Other _____

13. What do you believe are the most effective strategies for addressing traffic congestion in the Killeen/Temple metro area? (Select up to 3)

- ☐ Construction of additional roadway capacity
- ☐ Improved traffic signal coordination
- ☐ Implementation of dedicated turn lanes
- ☐ Projects/policies to reduce the number of crashes on roadways
- ☐ Improving/expanding transit service to increase ridership
- ☐ Projects/policies that promote walking and biking
- ☐ Programs that incentivize carpooling/ridesharing, traveling at off-peak periods, or telecommuting
- ☐ Land use policies that promote alternative forms of transportation and/or shorten travel times (e.g. mixed-use development featuring live/work/play options)

Appendix B

Detailed Congestion Hotspot Data

Congestion Data

The tables on pages B-3 through B-5 contain detailed data for each segment of the CMP network that was used to identify congestion hotspots in the region. The congestion scores were computed by first weighting the raw performance measure data based on how many data sources were reflected in each segment, as seen in the table below:

	Number of Sources	NPMRDS	INRIX	TDM	Google	Total
All Sources	5%	20%	50%	20%	5%	**100%**
TDM + INRIX	5%		60%	30%	5%	**100%**
TDM + NPMRDS	5%	50%		40%	5%	**100%**
TDM Only	25%			70%	5%	**100%**

The weighted raw data were then converted to scores on a scale of zero (0) to one (1), with a value of one representing the worst performing segment on the network and the remaining scores reflecting the relative performance of each segment against the rest. Finally, the individual performance measures were combined into a weighted "congestion score" metric for each direction of each segment that was then averaged for both directions on a segment to assign an overall congestion rank for the segment.

The weights for the congestion score computation are shown below:

Measure	TTI	Delay	V/C Ratio	2040 V/C Increase	Google Score	Data Availability Score
Weight	25%	25%	25%	5%	5%	15%

Prioritization Data

The table on page B-6 details the data for the individual weighting criteria used to prioritize the segments in the CMP network. The prioritization score calculation relies primarily on the severity of congestion on a segment, but also considers the volume of traffic, crash rates (overall and percentage that are rear-end collisions), presence of schools, presence of transit service, and number of times the segment was mentioned as a congestion hotspot in the 2016 KTMPO Congestion Survey (see Appendix A). The weights used for each criterion were developed in collaboration with the KTMPO Technical Advisory Committee (TAC) and are detailed below:

Criteria		Weight
Congestion Rank		30%
Volume		20%
Safety	Crashes	15%
	Rear-End Crashes	10%
Transit		15%
School		5%
Public Input		5%
Total		*100%*

Appendix C

2018 CMP Update - Results and Methodology Summary

Congestion Data

The tables on pages C-4 through C-7 contain detailed data for each segment of the CMP network that was used to identify congestion hotspots in the region. The congestion scores were computed by first weighting the raw performance measure data based on the data sources available for each segment, as seen in the table below:

	NPMRDS	INRIX	TDM	Total
All Sources	50%	30%	20%	**100%**
TDM + INRIX		60%	40%	**100%**
TDM + NPMRDS	60%		40%	**100%**
TDM Only			100%	**100%**

The weighted performance measures were then converted to scores on a scale of zero (0) to one (1), with a value of one representing the worst performing segment on the network and the remaining scores reflecting the relative performance of each segment against the rest. Finally, the individual performance measure scores were combined into a weighted "congestion score" metric for each direction of each segment. The congestion score was then averaged for both directions of a segment to assign an overall congestion rank for the segment.

The weights for the congestion score computation are shown below:

Measure	TTI	Delay	V/C Ratio	2040 V/C Increase	Google Score	Data Availability Score
Weight	25%	25%	25%	5%	5%	15%

Prioritization Data

The tables on page C-8 and C-9 detail the data for the individual weighting criteria used to prioritize the segments in the CMP network. The prioritization score calculation relies primarily on the severity of congestion on a segment, but also considers the volume of traffic, crash rates (overall and percentage that are rear-end collisions), presence of schools, presence of transit service, and number of times the segment was mentioned as a congestion hotspot in the KTMPO Congestion Survey. The weights used for each criterion were developed in collaboration with the KTMPO Technical Advisory Committee (TAC) and are detailed below. Note that the Congestion Rank Change criteria was added in the 2018 CMP Update to consider how segments were performing over time in terms of congestion.

Criteria		Weight
Congestion Rank		25%
Congestion Rank Change		5%
Volume		20%
Safety	Crashes	15%
	Rear-End Crashes	10%
Transit		15%
School		5%
Public Input		5%
Total		*100%*

2018 Methodology Updates and Findings

The following summary documents the methodology changes and findings of the 2018 update to the Killeen-Temple Metropolitan Planning Organization (KTMPO) Congestion Management Process (CMP).

Congestion Data Sources

To analyze congestion along the CMP network, this CMP Update used three quantitative data sources: National Performance Management Research Data Set (NPMRDS), INRIX, and KTMPO's Regional Travel Demand Model (TDM). While the sources are similar to those used in the 2016 CMP Update, there are key differences in the data used for this most recent effort.

NPMRDS

Previously, the NPMRDS was developed by HERE. In 2017, the Federal Highway Administration (FHWA) chose INRIX, partnered with the Center for Advanced Transportation Technology Laboratory (CATT Lab) at the University of Maryland, to develop and manage the NPMRDS[1]. This 2018 CMP Update uses the 2017 data provided by INRIX through CATT Lab's Regional Integrated Transportation System (RITIS) data sharing application.

INRIX

The 2018 CMP again uses INRIX data provided by the Texas Department of Transportation (TxDOT); however, the newer version of the data was processed by the Texas A&M Transportation Institute (TTI) before distribution. Previously, the project team was responsible for processing the raw data.

TDM

The 2018 CMP uses an updated version of the KTMPO TDM and model runs for years 2018 (existing conditions) and 2045 (future no build). One major difference between the new (2045) and old (2040) TDM is that the new model does not include time-of-day functionality or outputs. For this reason, peak period TDM congestion measures were dropped from the congestion score calculations.

Congestion Score Weighting Changes

Due to changes and improvements in the quality of the different quantitative congestion data sources, the weights applied to the raw performance measures for the 2018 CMP Update were revised. The revised weighting is meant to reflect confidence in the quality of data for a particular source and aims to prioritize observed data (e.g. NPMRDS and INRIX). The first table included on page C-1 shows the weights used to create weighted congestion performance measures based on data availability.

CMP Network Update

The 2016 CMP network was updated to include additional roadways for which data was previously unavailable. Major additions to the network include FM 93 and Clear Creek Road. The updated CMP network also includes extensions to IH 35, S. 31st St, Business

---

[1] Source: http://inrix.com/press-releases/npmrds/

190 near Nolanville, and W.S. Young Drive. Additionally, data was available for Segment 3 (SH 9) and Segment 5 (US 190 Bypass), which were previously included in the CMP but did not have available data to include in the congestion scoring. The map below shows the 2016 CMP Network and the additions included in the 2018 network update.
Prioritization Process

The prioritization process for the 2018 CMP remained the same with the exception of an added evaluation criteria: Congestion Rank Change. This evaluation criteria compared the 2016 and 2018 congestion ranking. Segments where the ranking became significantly worse (i.e. higher congestion ranking) were assigned a higher prioritization score, segments where the ranking dropped significantly were given a lower prioritization score. The updated evaluation criteria weighting used to calculate prioritization score is included in the table below.

Criteria		Weight
Congestion Rank		25%
Congestion Rank Change		5%
Volume		20%
Safety	Crashes	15%
	Rear-End Crashes	10%
Transit		15%
School		5%
Public Input		5%
Total		***100%***

Findings

Due to differences in data, additions to the CMP network, and real-life changes to the region's roadway network, there were several significant changes to the prioritized list of CMP segments. The tables below show a comparison between the 2016 and 2018 priority rank for each CMP segment.

The largest increases in priority ranking for arterials occurred along Segments 24 (SH 317), 13 (WS Young Dr), 29 (SH 53/Adams Ave.), and 8 (FM 2410). The large increase in priority ranking for Segment 24 is due to a large increase in congestion, which may be attributed to major construction occurring along SH 317 during the congestion data collection period. The increased rankings for Segments 13 and 29 are also mostly associated with increases in congestion score. While the congestion ranking does increase for Segment 8 as well, the increase in priority ranking can also be attributed to an increase in the percentage of crashes along the roadway that are rear-end and an increase in the number of schools located along the segment[2]. In general, the priority ranking for arterials appear to be much more variable compared to highways from year-to-year. Note that the NPMRDS (which was determined to be the highest quality congestion data source of the three) was not available for the majority of arterial segments.

For highways, the largest increases in priority ranking occurred along Segments 20B, 20D, and 20C. The change in priority rank for Segments 20D and 20C is mostly due to congestion rank changes, which are an expected result of ongoing construction during the data collection period. Conversely, for segments where roadway projects were completed prior to the congestion data collection period (2017), the priority and congestion ranking decreased (i.e. congestion improved). Examples of projects improving congestion appear along Segments 4C and 20A.

---

[2] Harker Heights High School was not included in the 2016 version of the school location data.

KTMPO CMP (2018) - Congestion Feedback Survey Results

The following presents the results of the 2018 KTMPO CMP Congestion Feedback Survey and compares these updated results to those generated from the 2016 version of the survey.

Question 1. Based on your daily travel experience, do you believe traffic congestion is a significant problem in the Killeen/Temple metropolitan area?

	2016	2018
Yes	91%	75%
No	9%	25%

Question 2. Which of the following best fits your definition of traffic congestion?
Question 3. What are the biggest causes of traffic congestion in the Killeen/Temple metro area?
Question 4. How often do you experience traffic congestion in the Killeen/Temple metro area?

	2016	2018
Daily - regularly (peak)	62%	56%
Daily - regularly (off-peak)	7%	2%
Daily - intermittently/sporadically	12%	10%
A few times a week	12%	8%
A few times a month	4%	23%
Other/No Response	3%	2%

Question 5. What mode of transportation do you use most often?

	2016	2018
Personal Car	98%	96%
Carpool/Rideshare	0%	2%
Walking	0%	2%
Biking	0%	0%
Public Transportation	0%	0%
Other/No Response	2%	0%

Question 6. In which zip code do you live?
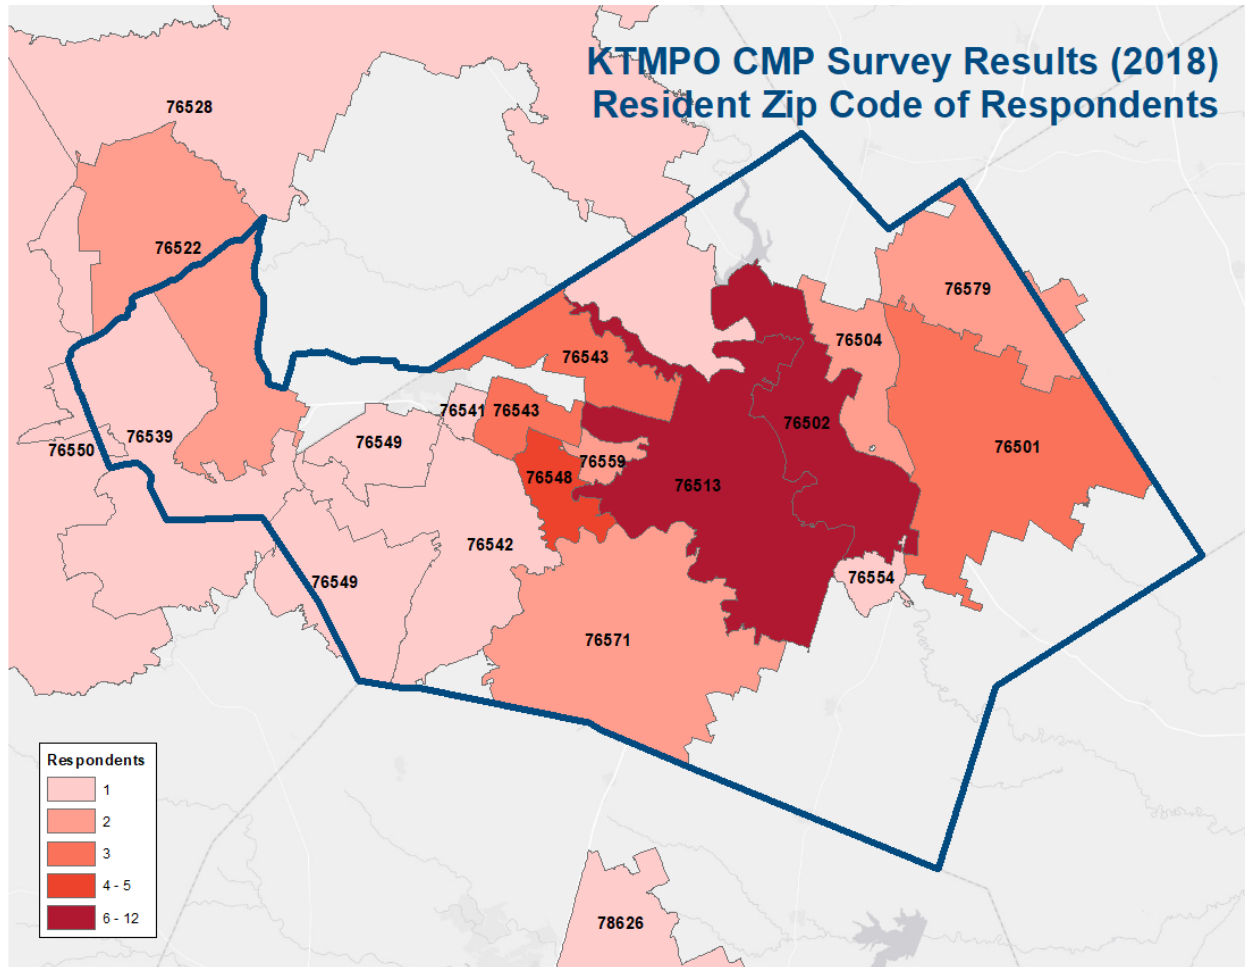

Question 7. To which zip code do you travel to the most (for work, school, etc.)?

KTMPO CMP Survey Results (2018)
Most Frequent Zip Code Respondents Travel To
Question 8. How long would it take (in minutes) to get to your most frequent destination (e.g. work) from home with no traffic congestion?
Question 9. How much extra time do you allow yourself (in minutes) to get to your destination on time to account for traffic congestion along your route?
Question 10. What actions do you take to avoid traffic congestion?
Question 11. In 2016, KTMPO established a Congestion Monitoring Network based on data availability and public feedback. The map below shows the highway segments of the monitoring network. From the list below, please select the segments where you experience the most traffic congestion.

KTMPO Area Highways

Legend:
- SH 9
- US 190
- US 190 Bypass
- SH 195
- I 35
- Loop 363
- SH 36
- US 190 E

Number of Responses

Segment	Responses
I 35 - C (Between North Loop 363 in Temple)	31
I 35 (North of Loop 363)	23
I 35 - B (Central Texas Express Way to Loop 363)	21
US 190 - D (E Stan Schlueter Loop to South Nolan Creek)	14
US 190 - C (Bypass to E Stan Schlueter Loop)	13
I 35 - A (Salado to Central Texas Express Way)	10
US 190 - E (South Nolan Creek to I 35)	10
Loop 363 - A (Southeast Loop 363 to 290)	9
Loop 363 - C (I 35 to SH 36)	7
US 190 Bypass	7
SH 195	5
US 190 - A (East 190 to Bypass)	5
Loop 363 - D (SH 36 to I 35)	4
Loop 363 -B (290 to I 35)	4
SH 9	1
US 190 E - A (Loop 363 to Pritchard Rd)	1
US 190 E - B (East of Pritchard Rd)	1
SH 36	0

Question 12. The 2016 Congestion Monitoring Network also included segments along major arterial streets. The map below shows the arterial segments within the Killeen/Copperas Cove area. From the list below, please select the segments where you experience the most traffic congestion.

Killeen/Copperas Cove Area Streets

Legend:
- 2nd St
- 38th St
- Ave D
- BU 190
- FM 116
- FM 2410
- Fort Hood St
- Hallmark Ave
- Rancier Ave
- Roy Reynolds Dr
- Stan Schleuter Loop
- Trimmier Rd
- US 190
- WS Young Dr
- Willow Springs Rd

Number of Responses

Segment	Number of Responses
None, I do not drive on these roadways	18
WS Young Rd	15
Stan Schleuter Loop	14
US 190	14
Fort Hood St	13
Trimmier Rd	13
FM 2410	9
Rancier Ave	8
BU 190	6
Ave D	4
FM 116	2
Roy Reynolds Dr	2
38th St	1
Willow Springs Rd	1
2nd St	0
Hallmark Ave	0

Question 13. The map below shows the arterial segments within the Temple/Belton area. From the list below, please select the segments where you experience the most traffic congestion.
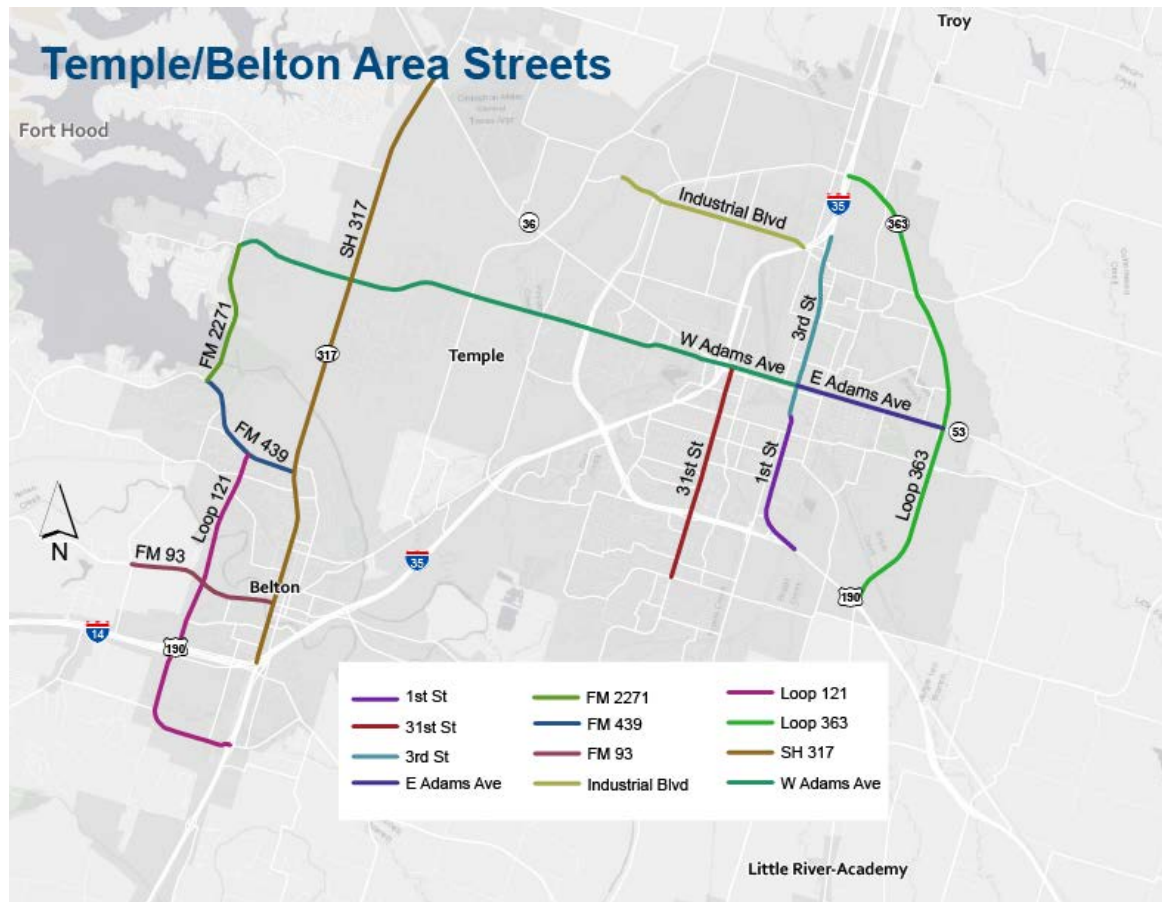

Question 14. The map below shows the entire 2016 Congestion Monitoring Network (in red) in the Killeen/Temple metro area.
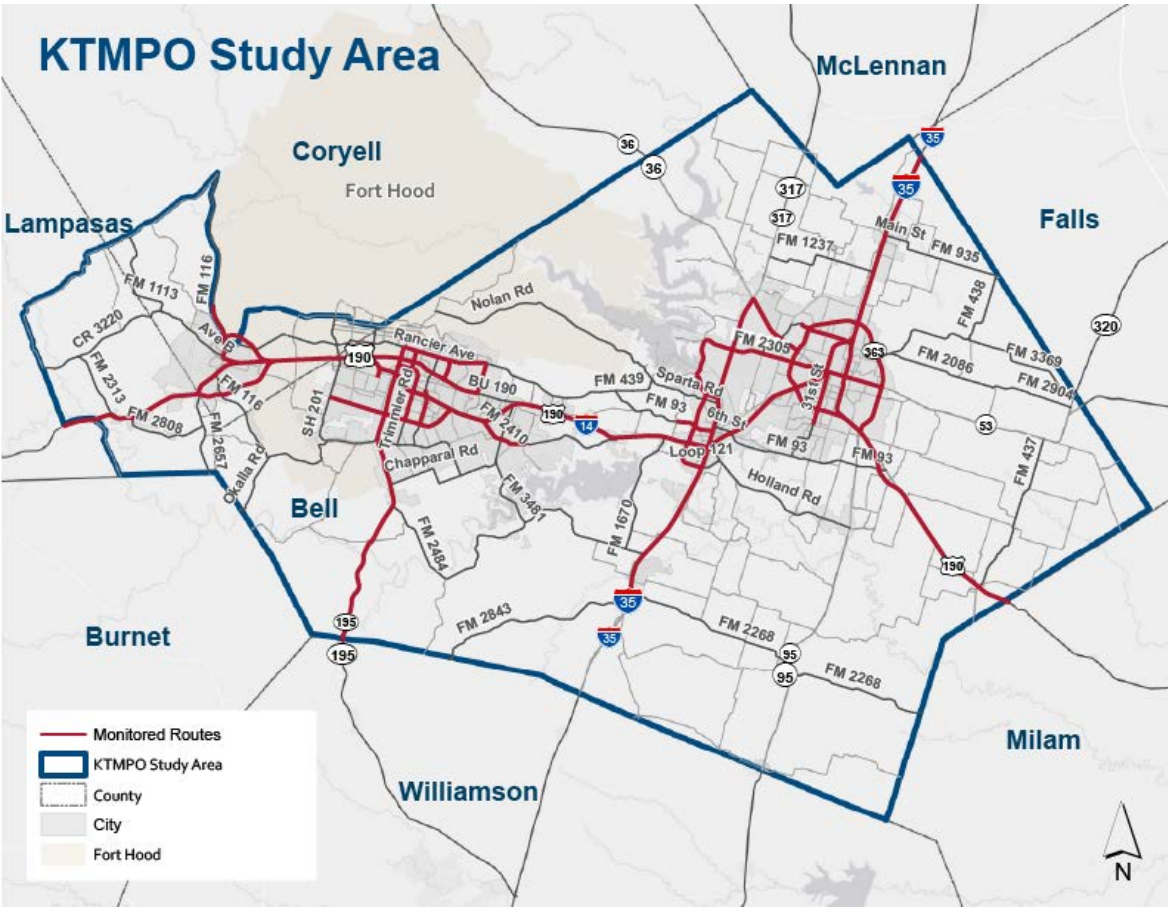

Question 14a. Are there any streets or highways in the region that are not included on the Congestion Monitoring Network (see above map) that you believe experience significant congestion?

Roadway	Mentions
Ave B from FM 116 to Summers Rd	1
Indian Trail	2
FM 3481 from FM 2484 to FM 2410	1
Veterans Memorial Blvd in Killeen	1
10th St in Killeen from Rancier to Hallmark	1
Trimmier Rd from Hallmark to IH 14	1
FM 93/IH 35 Intersection	1
W. Adams Ave from Kegley to Hwy 317	1
FM 93 from S. 31st St to IH 35	1
Clear Creek Rd from US 190 to Stan Schleuter Loop	2
Kegley Rd from IH 35 to W. Adams Ave	1
Lake Rd from FM 2410 and Chaparral Rd	1
6th St in Belton	1
Old Waco Rd and W. Adams Ave	1
Old Waco Rd and Poison Oak	1
Charter Oaks Dr and S. Pea Ridge	1
Main Street in Belton	2
Kegley Rd and W. Adams Ave.	1
FM 93 from Belton to Temple	1
FM 93 from 31st St heading west	1
CR 3220 from FM 2313 to FM 1113	1

Question 14b. Are there any streets or highways in the region that are not included on the Congestion Monitoring Network (see above map) that you believe will experience significant congestion in 10 years?

Roadway	Mentions
Summers Rd	1
Luther Church Rd from Ave Bto FM 116	1
Constitution Ave from BUS 190 to Old Copperas Cove	1
FM 93	4
FM 436	1
SH 95	2
FM 439	3
FM 3481 from FM 2410 to Chaparral Rd	1
Knights Way	1
Elms Rd	1
10th St in Killeen	1
Chaparral Rd from SH 195 to FM 3481	1
Indian Trail from US 190 to Veterans Memorial Blvd	1
Lake Rd from FM 2410 to Chaparral Rd	1
Old Waco Rd	3
Charter Oaks Dr	2
Airport Rd	1
Research Blvd	1
Kegley Rd	1
Scott Blvd	1
Chaparral Rd	1
Stagecoach Rd	1
Main St	1
Warriors Path	1
Loop 121 in Belton	1
US 190 Bypass in Copperas Cove	1

Question 15. What do you believe are the most effective strategies for addressing traffic congestion in the Killeen/Temple metro area?
Appendix C (continued)

2020 CMP Update - Results and Methodology Summary

Congestion Data

The tables on pages C-2 through C-7 contain detailed data for each segment of the CMP network used to identify congestion hotspots in the region. The congestion scores were computed by first weighting the raw performance measure data based on the data sources available for each segment, as seen in the table below:

	NPMRDS	INRIX	TDM	Total
All Sources	50%	30%	20%	100%
TDM + INRIX		60%	40%	100%
TDM + NPMRDS	60%		40%	100%
TDM Only			**100%**	100%

The weighted performance measures were then converted to scores on a scale of zero (0) to one (1), with a value of one representing the worst performing segment on the network and the remaining scores reflecting the performance of each segment relative to the rest. Finally, the individual performance measure scores were combined into a weighted "congestion score" metric for each direction of each segment. The congestion score was then averaged for both directions of a segment to assign an overall congestion rank for the segment.

The weights for the congestion score computations are shown below:

Measure	TTI	Delay	V/C Ratio	2040 V/C Increase	Google Score	Data Availability Score
Weight	25%	25%	25%	5%	5%	15%

Prioritization Data

The tables on page C-8 and C-9 detail the data for the individual weighting criteria used to prioritize the segments in the CMP network. The prioritization score calculation relies primarily on the severity of congestion on a segment, but also considers the volume of traffic, crash rates (overall crashes and percentage of crashes that are rear-end collisions), presence of schools, presence of transit service, and number of times the segment was mentioned as a congestion hotspot in the 2018 KTMPO Congestion Survey. The weights used for each criterion were developed in collaboration with the KTMPO Technical Advisory Committee (TAC) and are detailed below. Note that the Congestion Rank Change criteria was added in the 2020 CMP Update to consider how segments were performing over time in terms of congestion.

Criteria		Weight
Congestion Rank		25%
Congestion Rank Change		5%
Volume		20%
Safety	Crashes	15%
	Rear-End Crashes	10%
Transit		15%
School		5%
Public Input		5%
Total		*100%*

2020 Methodology Updates and Findings

The following summary documents the methodology and findings of the 2020 update to the Killeen-Temple Metropolitan Planning Organization (KTMPO) Congestion Management Process (CMP).

Congestion Data Sources

To analyze congestion along the CMP network, this CMP Update used three quantitative data sources: National Performance Management Research Data Set (NPMRDS), INRIX, and KTMPO's Regional Travel Demand Model (TDM). The sources are updated versions of similar data resources used in previous CMP updates.

NPMRDS

In 2017, the Federal Highway Administration (FHWA) chose INRIX, partnered with the Center for Advanced Transportation Technology Laboratory (CATT Lab) at the University of Maryland, to develop and manage the NPMRDS[1]. The 2020 CMP Update used the 2019 data provided by INRIX through CATT Lab's Regional Integrated Transportation Information System (RITIS) data sharing application. The NPMRDS data covers the Interstate Highway System and non-interstate segments of the National Highway System (NHS) within the KTMPO study area. The KTMPO has continuing access to the NPMRDS through a RITIS data sharing agreement executed on August 26, 2020.

INRIX

The 2020 CMP Update again used additional INRIX data provided by the Texas Department of Transportation (TxDOT) through a statewide data license. This data expands the NPMRDS to provide location based (cell phone) data on travel speeds, delay, and reliability for many of the major roads across the state, including the KTMPO study area. TxDOT provides KTMPO access to this data free of charge for use in any joint activities related to the statewide or metropolitan transportation planning process, such as the CMP.

TDM

The 2020 CMP Update used the KTMPO TDM and model runs for years 2018 (as a surrogate for existing traffic conditions) and 2045 (as the future no build) traffic forecasts. The CMP uses the reported current traffic volumes, current congestion levels, and the change in congestion levels between current and 2045 forecast conditions in conjunction with the location based NPMRDS and INRIX data, as part of the congestion factors used in segment prioritization.

Congestion Score Weighting Changes

When calculating congestion scores, weights are applied based on the perceived quality of the different quantitative congestion data sources. The aim is to prioritize observed data (e.g., NPMRDS and INRIX) over forecasted or subjective qualitative data. The 2020 CMP process used the same weighting protocols used in the previous 2018 CMP update. The first table included on page C-12 shows the weights in the 2020 CMP Update used to create weighted congestion performance measures.

[1] Source: http://inrix.com/press-releases/npmrds/

CMP Network Update

The 2020 CMP network includes the Interstate Highway System, major highways on the NHS and Texas State Roadway System, as well as numerous other major arterial roadways throughout the KTMPO study area. The 2020 CMP Network is depicted in the map below.
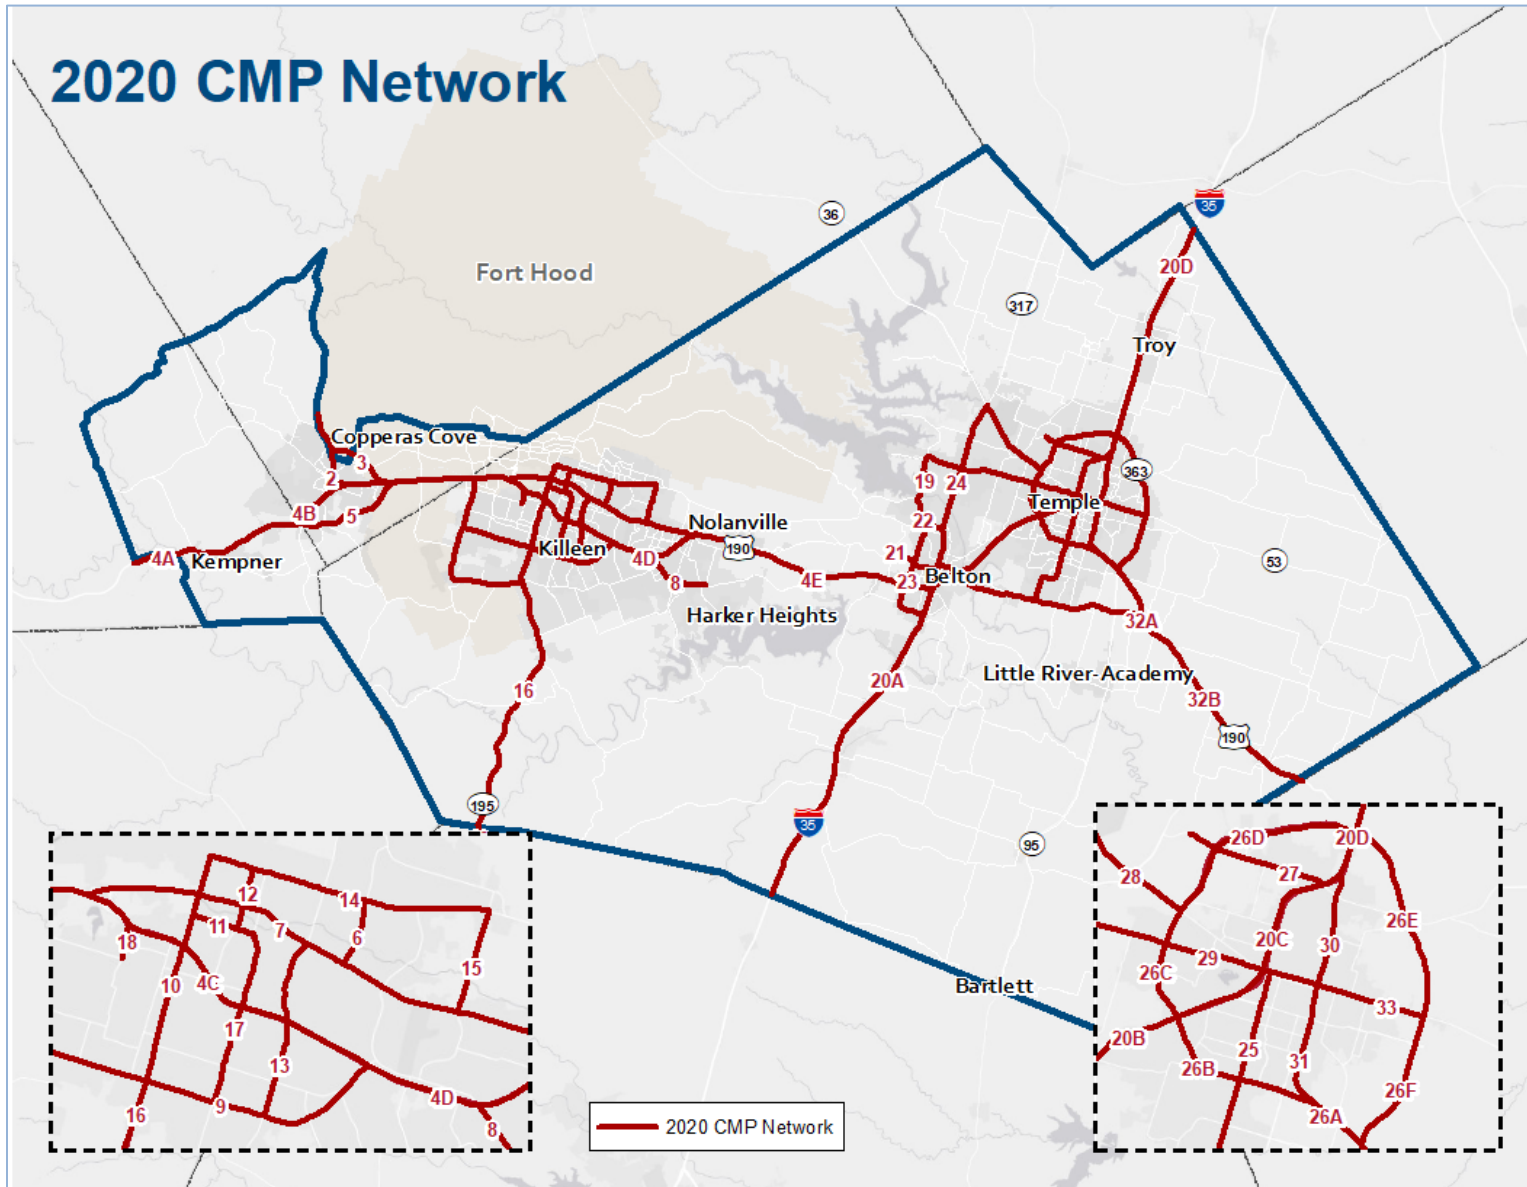

Prioritization Process

The prioritization process for the 2020 CMP Update used the same methodology as the 2018 CMP Update. This evaluation criteria compared the 2018 and 2020 congestion ranking. Segments where the ranking became significantly worse (i.e., higher congestion ranking) were assigned a higher prioritization score, and segments where the ranking dropped significantly were given a lower prioritization score. The evaluation criteria weighting used to calculate prioritization score is included in the table below.

Criteria		Weight
Congestion Rank		25%
Congestion Rank Change		5%
Volume		20%
Safety	Crashes	15%
	Rear-End Crashes	10%
Transit		15%
School		5%
Public Input		5%
Total		*100%*

Findings

Updated congestion data, crash records and other information used in the analysis reflected real-life changes to travel conditions on the region's roadway network. Observed shifts in congestion, level of service, delay and crash rates resulted in some adjustments to the rankings in the prioritized list of CMP segments. The tables below show a comparison between the 2018 and 2020 priority rank for each CMP segment.

It is encouraging to note that the volatility in the change in segment rankings between the 2018 and 2020 CMP updates is much lower than was reflected in the change in segment rankings between 2016 and 2018. Hopefully, this trend is a function of the improving quality and availability of location-based data such as NPMRDS and INRIX for use in the CMP process. Improved results can also be expected as more years of historical data become available and KTMPO can begin to use a 5-year rolling average to track transportation system performance trends and outcomes as contemplated in the FAST Act performance management and performance-based planning processes.

The map on the following page presents a visual representation of the delay per mile on CMP segments reported by the location-based data sources. A full set of geographic information system (GIS) graphic and non-graphic data layers containing the data used in the CMP segment analysis and reprioritization has been provided with this appendix for use by KTMPO in conducting more detailed analysis as part of the metropolitan planning process.

2020 CMP Network - Delay per Mile

Delay by Mile

――	0-7 Seconds/Mile (Lowest Quantile)
――	7-27 Seconds/Mile
――	27-70 Seconds/Mile
――	70-353 Seconds/Mile (Highest Quantile)
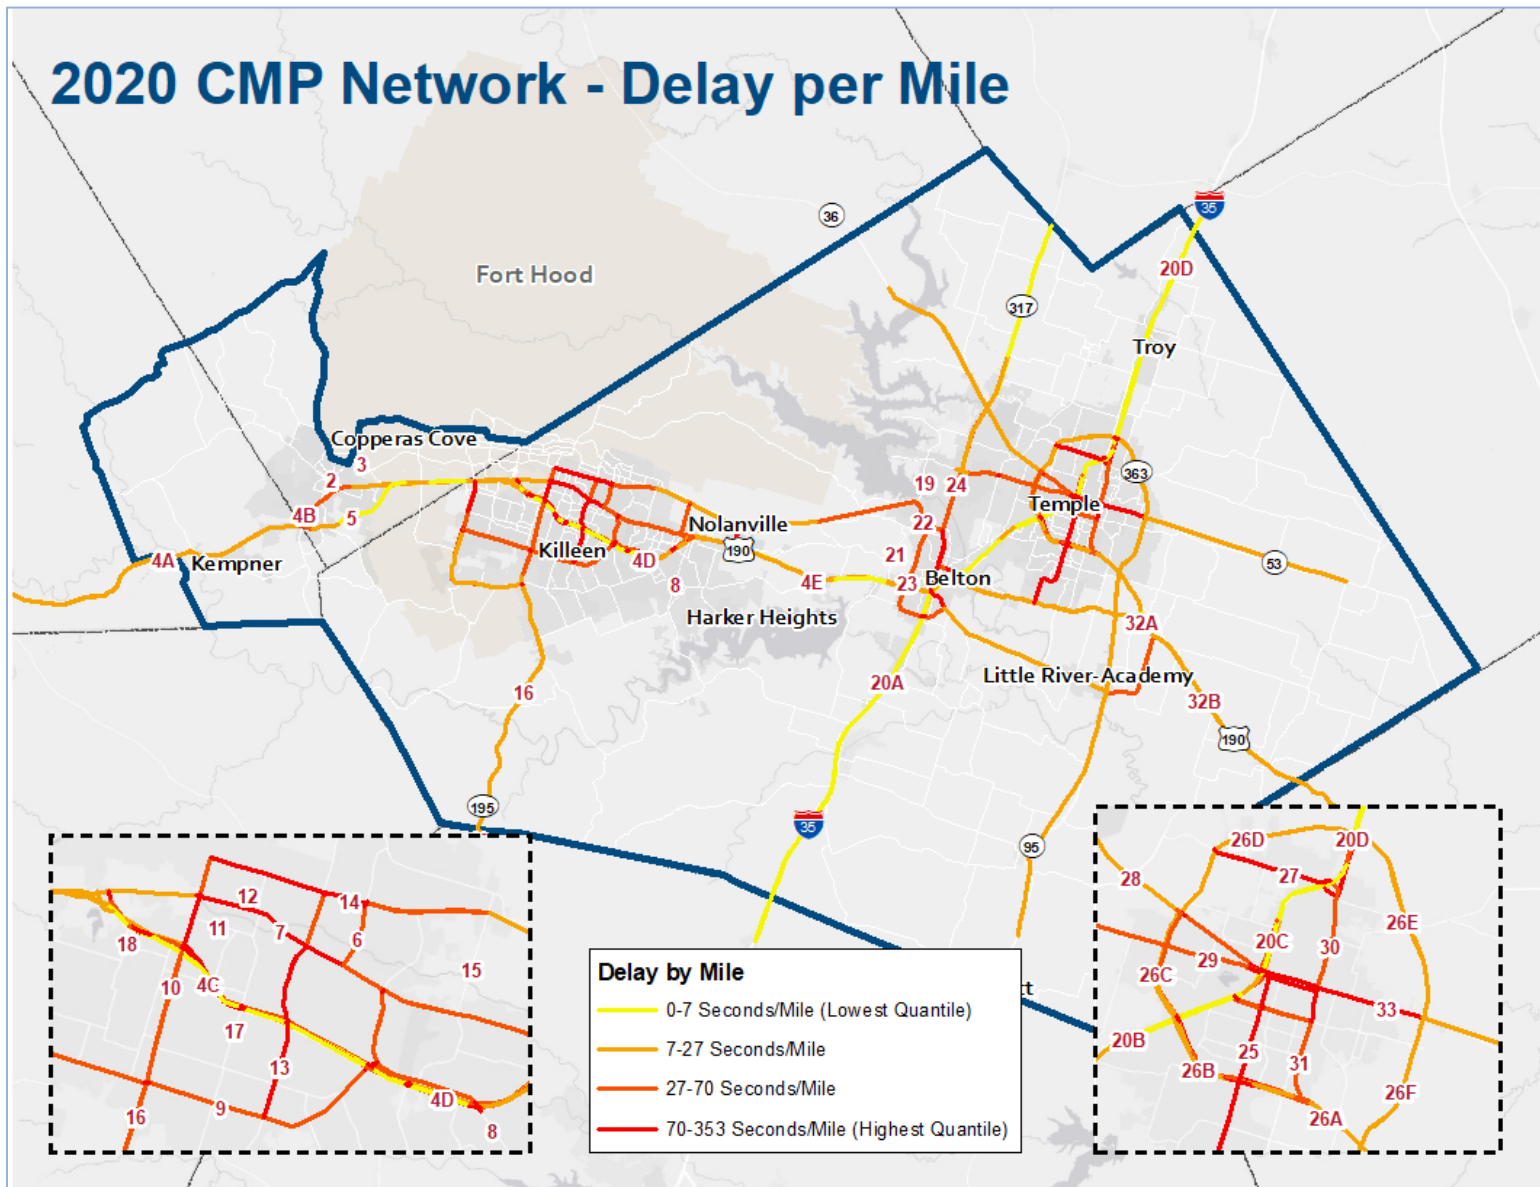

Appendix D

2023 CMP Update – Analysis of Completed Added
Capacity Projects

Appendix D. Analysis of Completed Added Capacity Projects

The Killeen Temple Metropolitan Planning Organization applied the Texas A&M Transportation Institute Congestion Management Process Assessment Tool (COMPAT: https://compat.tti.tamu.edu/) in analyzing the impacts to roadway congestion, through before and after congestion and reliability performance measurements, to the degree practically possible. The analysis covers the time-period of 2016-2021.

Note: 2017 reflects an exogenous data event related to conversion of the INRIX probe-based data source from a primarily truck-oriented data set to a primarily passenger-vehicle-oriented data set. This resulted in a large increase in volume and measured speeds that also show up across all corridors as an increase in delay and a decrease in roadway reliability. 2020 reflects unprecedented low congestion levels, as a direct result of the COVID-19 pandemic.

The selected performance measurements include:

- **Person Hours of Delay:**
  Person hours of delay is the difference in travel time between uncongested traffic and congested traffic. This is the sum of all persons in vehicles traveling for a year across the selected corridor.
- **Planning Time Index-80th percentile:**
  80th percentile Planning Time Index (PTI) is the ratio of the 80th percentile travel time as compared to the free-flow travel time. This planning time measures how much extra time (1.2 = + 20%, 1.3 = +30%, and so on) to add into an average travel time across the selected corridor to make it to the destination on time 80% of the time, (i.e., being late only 1 time per week).
- **Travel Time Index:**
  Travel Time Index is the ratio of the peak-period travel time as compared to the free-flow travel time. This measure is computed for the AM peak period (6:00 a.m. to 9:00 a.m.) and PM peak period (4:00 p.m. to 7:00 p.m.) on weekdays. It serves as a measure of how reliable roadways are during peak traffic congestion periods. A travel time index number that equals 1.2 means the corridor typically requires 20% more travel time over the selected corridor during peak periods.

KTMPO staff utilized the selected performance measure data to identify congestion trends, the overall effectiveness of each project, and identification of next steps.

- **Trend of Performance Measures:** Analysis of the selected performance measures to determine a declining or increasing trend in congestion.
  - A travel time index of 1.00-1.09 is considered "uncongested" for the KTMPO region.
  - A travel time index of 1.10-1.25 is considered "nearing congestion" for the KTMPO region.
  - A travel time index of 1.25 or greater is considered "congested" for the KTMPO region.
- **Strategy Identification:**
  - Remove from Monitoring Network – If a segment remains uncongested for 5 years after construction and is not trending upwards, consider removing from monitoring network.
  - Continue to Monitor – If a segment is uncongested, but trending upward, or is nearing congestion, but trending downward continue to monitor.
  - CMP Strategy – If a segment is nearing congestion and trending upward, or is currently congested continue to monitor and recommend review for identification of CMP strategy
- **Overall Project Effectiveness:**
  - Marginal, segment does not exhibit the intended benefits of investment.
  - Fair, segment exhibits some intended benefits of investment.
  - Exceptional, project greatly exhibits intended benefits of investment.

Some projects were ongoing as of the date of this analysis. Future updates will use the same segments selected for the purposes of maintaining consistency in comparing year-to-year segmentation performance oriented toward capacity planning projects.

Table 1 depicts all regional added-capacity projects going back a period of ten years, their KTMPO ID, CSJ Number, Project Name, Limits, Description, Estimated Cost, Let Date, and Completion Date.

Table 1. Ten-Year List of Added Capacity Projects for the KTMPO Region

KTMPO Project ID	CSJ Number	Project Name	Project Limits	Project Description	Estimated Cost	Actual Let Date	Actual Completion Date
T15-06c	0015-14-091	IH 35 - Temple	S Loop 363 to N Loop 363	Widen from 6 to 8 lanes	$103,548,650	9/1/2012	7/29/2020

W40-06	0231-03-145	US 190	FM 3423 (Indian Trail) to FM 2410 in W Belton	Widen main lanes from 4 to 6 lane divided freeway and ramp alignments	$39,000,000	6/1/2019	10/29/2022
W40-05	0231-04-060	US 190	FM 2410 in W Belton to IH-35	Widen main lanes from 4 to 6 lanes and resurface	$35,000,000	6/1/2020	06/01/2023
W35-12	0185-01-030	US 190 (Rogers Relief Route)	2.0 mi S of FM 436 in Heidenheimer to Milam County Line	Widen from 2 to 4 lane divided rural highway	$62,800,000	11/1/2019	Ongoing Es. Complete: 2024/2025
W40-04a(1)	2502-01-021	Loop 121 Phase 1a	Lake Rd (FM 439) to South of W Ave O	Widen from two lanes to four lanes with a raised median	$30,800,000	8/1/2021	Ongoing Est Complete 2024/2025

The next section contains individual project profiles determined from the COMPAT analysis.

Completed Projects:

KTMPO Project ID: T15-06C

I-35 construction through Temple, TX from South Loop 363 to North Loop 363 initiated on September 1, 2012 and completed on July 29, 2020. Capacity expansion included widening I-35 from 6 to 8 lanes. Figure 1 displays the project limits on I-35 for T15-06c.

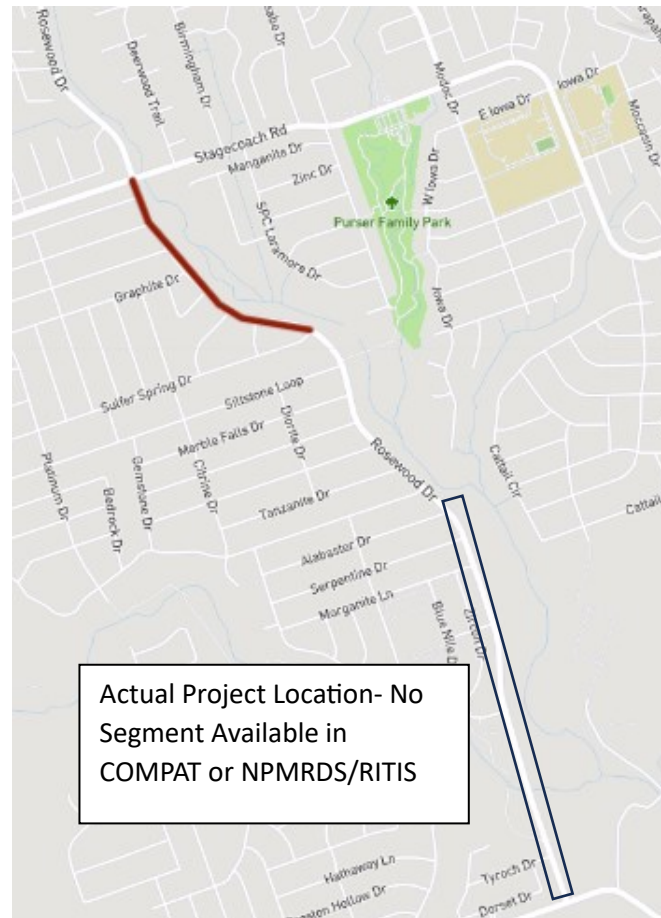

Figure 1. T15-06c Project Limits

Table 2 depicts key annualized performance measure data for the selected corridor.

Table 2. 2016-2021 Congestion Performance Measures for T15-06c

Year	Person Hours of Delay	Planning Time Index-80th Percentile	Travel Time Index
2016	126662	1.14	1.05
2017	295610	1.26	1.13
2018	97029	1.08	1.03
2019	48782	1.09	1.01
2020	6167	1.07	1.00
2021	7429	1.06	1.01

Figures 2-7 display congestion performance measure trends and visualizations over time for person hours of delay, planning time index-80th percentile, and travel time index. The corridor shows a declining trend of reported person hours of delay, planning time index and travel time index values from 2016-2021 following a large increase in 2017.

- **Trend of Performance Measures:** Uncongested
- **Strategy Identification:** Continue to Monitor
- **Overall Project Effectiveness:** Exceptional

Figure 7. T15-06c Travel Time Index Performance Over Time

KTMPO Project ID: T25-11

State Highway 317 construction through Belton, TX from .2 miles south of FM 2305 to .4 miles north of FM 439 initiated on May 1, 2016 and completed on November 14, 2019. Capacity expansion included reconstructing and widening from two to four lanes with a raised median. Figure 8 displays the project limits for project T25-11.

Figure 8. T25-11 Project Limits

Table 3 depicts key annualized performance measure data for the selected corridor.

Table 3. 2016-2021 Congestion Performance Measures for T25-11

Year	Person Hours of Delay	Planning Time Index- 80th Percentile	Travel Time Index
2016	63802	1.26	1.17
2017	101517	1.51	1.32
2018	89649	1.36	1.22
2019	43907	1.13	1.07
2020	12970	1.12	1.03
2021	37977	1.15	1.08

Figures 9-14 display congestion performance measure trends and visualizations over time for person hours of delay, planning time index-80th percentile, and travel time index. The corridor shows a declining trend of reported person hours of delay, planning time index and travel time index values from 2016-2021 following a large increase in 2017.

- **Trend of Performance Measures:** Uncongested
- **Strategy Identification:** Continue to Monitor
- **Overall Project Effectiveness:** Exceptional

KTMPO Project ID: H15-02b

FM 2410 construction through Harker Heights, TX from Roy Reynolds Dr. to Commercial Dr. initiated on July 1, 2016 and completed on October 21, 2020. Capacity expansion included widening from a 2 to 4 lane roadway with sidewalks, median and turn. Figure 15 displays the project limits for project H15-02b.
Figure 15. H15-02b Project Limits

Table 4 depicts key annualized performance measure data for the selected corridor.

Table 4. 2016-2021 Congestion Performance Measures for H15-02b

Year	Person Hours of Delay	Planning Time Index-80th Percentile	Travel Time Index
2016	39918	1.26	1.16
2017	168030	1.44	1.29
2018	53142	1.34	1.21
2019	42185	1.21	1.12
2020	11213	1.11	1.03
2021	41449	1.23	1.12

Figures 16-21 display congestion performance measure trends and visualizations over time for person hours of delay, planning time index-80th percentile, and travel time index. The corridor shows a declining trend of reported person hours of delay, planning time index and travel time index values from 2016-2021 following a large increase in 2017.

- **Trend of Performance Measures:** Nearing Congestion
- **Strategy Identification:** Continue to Monitor
- **Overall Project Effectiveness:** Fair

KTMPO Project ID: T35-24

The Prairie View Road Enhancements construction through Temple, TX from State Highway 317 to Pea Ridge Road initiated on January 1, 2018 and completed on June 2, 2020. Capacity expansion included construction of a 4-lane roadway, aligning FM 2483 to Prairie View Rd with a signalized intersection. Figure 29 displays the project limits for project T35-24.

Figure 22. T35-24 Project Limits

Table 6 depicts key annualized performance measure data for the selected corridor.

Table 5. 2016-2021 Congestion Performance Measures for T35-24

Year	Person Hours of Delay	Planning Time Index-80th Percentile	Travel Time Index
2016	4941	1.16	1.08
2017	1023	1.11	1.06
2018	1952	1.19	1.11
2019	2072	1.19	1.11
2020	3668	1.17	1.09
2021	6503	1.29	1.13

Figures 30-35 display congestion performance measure trends and visualizations over time for person hours of delay, planning time index-80th percentile, and travel time index. While the data set does not cover the complete period of construction, having finalized in December of 2022, thus far the corridor shows an increasing trend of reported person hours of delay, planning time index and travel time index values from 2016-2021.

- **Trend of Performance Measures:** Nearing Congestion
- **Strategy Identification:** Continue to Monitor
- **Overall Project Effectiveness:** Fair

Figure 28. T35-24 Travel Time Index Performance Over Time

KTMPO Project ID: K30-02

The Rosewood Drive Extension construction through Killeen, TX from Chaparral Drive north to Riverstone Drive initiated on March 1, 2018 and completed on July 17, 2020. Capacity expansion included construction of a 4-lane roadway with center median and an off-system bridge. Figure 22 displays the project limits for project K30-02.

Note: Performance measures were unavailable in COMPAT and in the UMD CATT Lab RITIS site for the project limits. Performance measures were therefore obtained for the Rosewood Drive portions north of the corridor from Sulfur Spring Drive to Stagecoach Road to gauge potential impacts from the Rosewood Drive Extension project.

Actual Project Location- No Segment Available in COMPAT or NPMRDS/RITIS

Figure 29. K30-02 Project Limits

Table 5 depicts key annualized performance measure data for the selected corridor.

Table 6. 2016-2021 Congestion Performance Measures for K30-02

Year	Person Hours of Delay	Planning Time Index- 80th Percentile	Travel Time Index
2016	6716	1.16	1.08
2017	1377	1.11	1.06
2018	2023	1.19	1.07
2019	2138	1.18	1.09
2020	1246	1.17	1.04
2021	941	1.09	1.03

Figures 23-28 display congestion performance measure trends and visualizations over time for person hours of delay, planning time index-80th percentile, and travel time index. The corridor shows a decreasing trend of reported person hours of delay, planning time index and travel time index values from 2016-2021.

- **Trend of Performance Measures:** Uncongested
- **Strategy Identification:** Continue to Monitor
- **Overall Project Effectiveness:** Exceptional

KTMPO Project ID: W40-02

The US 190 construction through Harker Heights, TX from 1 mile west of FM 2410 to FM 3423 (Indian Trail) initiated on December 1, 2017 and completed on August 21, 2020. Capacity expansion included widening main lanes from a 4 to 6 lane divided freeway along with ramp alignments. Figure 36 displays the project limits for project W40-02.

Figure 36. W40-02 Project Limits

Table 6 depicts key annualized performance measure data for the selected corridor.

Table 7. 2016-2021 Congestion Performance Measures for W40-02

Year	Person Hours of Delay	Planning Time Index-80th Percentile	Travel Time Index
2016	6522	1.02	1.00
2017	9320	1.06	1.00
2018	11098	1.06	1.01
2019	6624	1.03	1.00
2020	2263	1.05	1.00
2021	5529	1.07	1.00

Figures 37-42 display congestion performance measure trends and visualizations over time for person hours of delay, planning time index-80th percentile, and travel time index. The corridor shows a decreasing trend of reported person hours of delay, an increase in planning time index and a slight decrease in travel time index values from 2016-2021.

- **Trend of Performance Measures:** Uncongested
- **Strategy Identification:** Continue to Monitor
- **Overall Project Effectiveness:** Fair

KTMPO Project ID: W40-06

The US 190 construction through Harker Heights and Nolanville, TX from FM 3423 (Indian Trail) to .25 miles west of Paddy Hamilton Road initiated on June 1, 2019 and completed on October 29, 2022. Capacity expansion included widening main lanes from a 4 to 6 lane freeway and resurfacing. Figure 43 displays the project limits for project W40-06.

Figure 43. W40-06 Project Limits

Table 8 depicts key annualized performance measure data for the selected corridor.

Table 8. 2016-2021 Congestion Performance Measures for W40-06

Year	Person Hours of Delay	Planning Time Index-80th Percentile	Travel Time Index
2016	2460	1.07	1.000
2017	5463	1.12	1.000
2018	7426	1.10	1.004
2019	1672	1.07	1.000
2020	4980	1.09	1.002
2021	9587	1.05	1.003

Figures 44-49 display congestion performance measure trends and visualizations over time for person hours of delay, planning time index-80th percentile, and travel time index. The corridor shows an increasing trend in person hours of delay and travel time index measures (though miniscule) and a decreasing trend in Planning Time Index 80th-percentile measures from 2016-2021.

- **Trend of Performance Measures:** Uncongested
- **Strategy Identification:** Continue to Monitor
- **Overall Project Effectiveness:** To be Determined

Completed Projects:

KTMPO Project ID: W35-12

The US 190 Rogers Relief Route construction through Heidenheimer and Rogers, TX from 2 miles south of FM 436 in Heidenheimer to the Milam County Line initiated on November 1, 2019 and is ongoing with an estimated completion date in the 2024-2025 time period. Capacity expansion included widening from a 2 lane to a 4 lanes divided rural highway. Figure 57 displays the project limits for project W35-12.

Figure 57. W35-12 Project Limits

Table 10 depicts key annualized performance measure data for the selected corridor.

Table 10. 2016-2021 Congestion Performance Measures for W35-12

Year	Person Hours of Delay	Planning Time Index- 80th Percentile	Travel Time Index
2016	8961	1.04	1.01
2017	9024	1.05	1.01
2018	9633	1.05	1.01
2019	8228	1.05	1.01
2020	9570	1.07	1.01
2021	11263	1.05	1.02

Figures 58-63 display congestion performance measure trends and visualizations over time for person hours of delay, planning time index-80th percentile, and travel time index. While the data set does not cover the complete period of construction, with construction ongoing, thus far the corridor shows an increasing trend in person hours of delay, travel time index measures and Planning Time Index 80th-percentile measures from 2016-2021.

- **Trend of Performance Measures:** Uncongested
- **Strategy Identification:** Continue to Monitor/Rehabilitation Ongoing
- **Overall Project Effectiveness:** To be Determined

KTMPO Project ID: W40-04a(1)

The Loop 121 Phase 1a construction through Belton, TX from FM 439 (Lake Road) to south of West Ave O initiated on August 1, 2021 and is ongoing with an estimated completion date in the 2024-2025 time period. Capacity expansion included widening from a 2 lane to a 4 lanes roadway with a raised median. Figure 64 displays the project limits for project W40-04a(1).
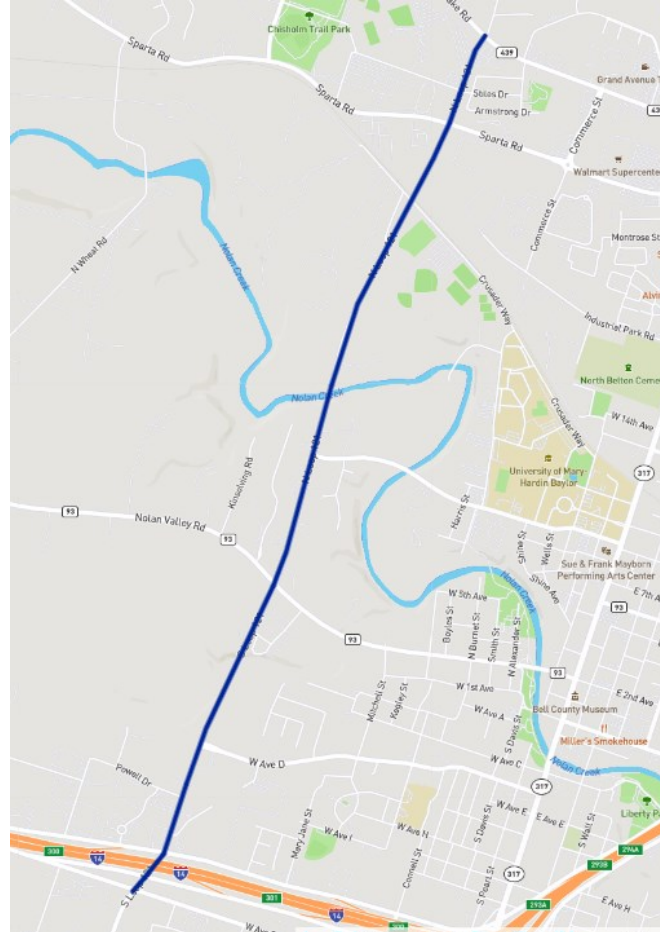

Figure 64. W40-04a(1) Project Limits

Table 11 depicts key annualized performance measure data for the selected corridor.

Table 11. 2016-2021 Congestion Performance Measures for W40-04a(1)

Year	Person Hours of Delay	Planning Time Index- 80th Percentile	Travel Time Index
2016	64240	1.44	1.28
2017	94757	1.55	1.37
2018	86774	1.46	1.31
2019	119776	1.46	1.32
2020	84804	1.42	1.30
2021	74306	1.52	1.31

Figures 65-70 display congestion performance measure trends and visualizations over time for person hours of delay, planning time index-80th percentile, and travel time index. While the data set does not cover the complete period of construction, with construction ongoing, thus far the corridor shows an increasing trend in person hours of delay, a slight increase in planning time index 80th-percentile measures, and a decrease in travel time index values from 2016-2021.

- **Trend of Performance Measures:** Congested
- **Strategy Identification:** Continue to Monitor/Rehabilitation Ongoing
- **Overall Project Effectiveness:** To be Determined
